Hi,

> tips on how to share an SLM 605.

I'm using a little grey box called "Autolink" that connects one printer to two computers.

Help me . I have rolling screens when i use alot of software . The problem i know is that it runs in 50hz. My problem is i can't find a utility that well make it run in 60hz. All the hertz programs i found either you have to run them (this wont work since im using menu disks that need to boot) or they make it run in 50hz which it is allready running in that.

Please Help Me!!

Buy a TV that can handle 50Hz.

This is true and is exactly the way Adobe Premier does it. You don't get the full sized finished article until you actually render to tape or disk.

>but that is another story. Mini-DV has a much higher capacity than
>a DVD and only stores 60mins of video. Also the data could be
>uncompressed (slightly) before editing is attempted.

One possible problem here is that in order to handle the high data rate most firewire cards employ some form of data codecs. The DVRaptor I have in my PC uses its own codec and I can bet that most manufacturers wouldn't allow the details of their codecs to be made freely available to allow conversion to another platform.

For instance I am only aware of one PC based edit solution which is available on a non-windows platform (Beos). Manufacturers will jealously guard the internals of their codecs.

>Once the edit is complete the data could be recompressed back to
>mini-DV format at leisure before being re-written to a tape.

Again this is how Premiere does it on my PC.

>A hardware encoder might make things faster and without one it would

The codec on my machine is software though it is probably hardware assisted.

>be annoying if the edit didn't turn out how you wanted it but that
>happens with ordinary tape-to-tape editing.

Yep, been there done that ;-)

>I assume you haven't seen Funmedia or Mountain then.

Personally I have never heard of either of these systems but then I have only recently got into NLE editing.

>Firewire drivers have more uses than video though. Has anyone
>seen the project to create drivers for Linux. I wonder if they
>could be ported to Mint ?

Not being an expert on such I would hazard a guess that the mint kernel may not be sufficiently fast to service the interrupt requests coming from the card but you never know.

NLE on my dual 550Mhz CPU PC is slow enough, God knows what it would be like on either of my TT or Nemesis/AB040 equiped Falcon!

Spencer

You could also adjust the frequency on your monitor. You have to open it up and be very careful, but I did it years ago on many of my ST monitors. I would imagine that there is a description of how to accomplish this in one of the faq's.

It's a similar principle to the nice litle knob that used to be on the back of tv's. Unfortunately I believe they are all internal on the ST monitors. Maybe I'm wrong on that though. Been years since I played around with one.

I emailed that guy a program that lets one change between 50 and 60mhz.
That, I hope, should do the trick.

Completely useless for an Atari laser, it doesn't use the printer port.
Instead it connects to the DMA port.

I have a manual switcher for the same purpose - BUT that's for the parallel port; is the Autolink for the DMA port?

I think the difficulty of sharing the Atari lasers is that they use the computer's memory to build up the page. At the very least you must make sure that one machine has finished printing before switching. It might be easier to network the 2 machines via the parallel or MIDI ports...

What monitor are you using - or TV? And what TV system - PAL or NTSC?
Most modern TVs and monitors will run at both 50 and 60 Hz without
adjustment - older ones may need the frame frequency to be tweaked.
There is a PD 50/60Hz switcher program available for the AUTO folder and
included on some game disks, but that won't help you with some
auto-booting games that don't have a normal directory. If they do, make
a copy (if possible) and add an AUTO folder with the switcher in it.

Is it possible to adjust the screen on the SM Mono monitors so it takes
up the full screen, mine is a little square in the centre.

Thanks

I see no reason why it would not work. The archive came with a file to
insert in the auto folder to cause the computer to boot in 60mhz as
well as the acc to switch between 50 and 60mhz.

Yes it is possible, but it involves some physical adjustment to the insides of the mono monitor.

How do u put a file into a auto-boot disk?? 1.)It dont fit since most are full 2) It allready boot into 60hz just when you select the game itll switch to 50hz.

3.) I don't own a hard drive so everything is off of floppys

: No such luck:) It need to be a program that can allow the
computer to reset
: and force it into 60hz.

The default for this is one single bit in TOS. NTSC-Ataris have
this 60Hz frequency as default, european PAL Ataris have 50Hz.
There is a program that changes this by a routine in the
bootsector of a disk, think it's "Bootsie".

I suppose that you need it for a game?

Only solution beside bootsector loaders is to use an american
TOS, maybe by way of a TOS loader, which also is a routine in
the bootsector of a disc. These loadable tOS images can usually
withstand a warm boot (reset with the button).

You could also fit double TOS versions into your machine.

some will some won't, there are only a few tweekable pots inside get some TV
trimming tools (cheap little plastic things) and give it a try bit by bit ,
be careful though as there are some lethal voltages inside

this is described on vezz's hardware hack page, the file you want is here:
http://www.freeweb.org/computer/vezz/atari/hardware/zip/bigmono.zip

the main page is here:

http://www.freeweb.org/computer/vezz/atari/hardware/index.html

I did this to my mono monitor without any probs, it's useful if you want to get 'real' wysiwyg, for example, you display a 1inch font on screen, then adjust the monitor until the font measures 1 inch and there you have it....

cheers, Phil

I'd say you're stuck then.

You must understand that those menu disks are from pirates. Very few of

these people respect programming rules and guidelines. Their auto boot
programs usually run off of the boot sector and use custom routines to read
their non-standard floppy formats, so if you replace the boot sector, the
disk won't work any more. For the same reason, you can't use AUTO folder
programs.

The only ways out of this, as I see it:
a) Get a TV or monitor that supports 50Hz (my SC1224 supports both, and I'm
in Europe)
b) Move to Europe. There are lots of nice places to live, our politicians
don't have sex with interns (or at least we don't give a damn if they do)
and we don't carry guns around schools.
c) Stop using pirate software and buy the Real Thing (tm).

Nick

Ok serious part:
So if i chunk out dough for a SC1224 itll run it??

Funny Part:
Your politicans are just as bad if not worse than ares . Except as you say
you dont care. We dont care either its the damn press and the other
politicans until they get caught ehehh.

Is this a commercial disk??? Hmmmm?? I did something like this before by putting in one disk until the one program booted from the auto folder and then inserted the next disk. But that may not work with a commercial disk.

: I have an american Tos i have an American Atari hehe I am
American. I need
: it so i can run some menu disks which are mostly euro for some
reason.

If I understand you correctly you have demos or games that switch from the default vertical synchronization of 60Hz to 50Hz, which makes the picture unvievable?

You now need some kind of utility to jump back to 60Hz again?

Don't believe you'll find something like that.

Try finding a monitor that can display both syncs, that's all you can do. Here in Europe it appears that most TV-sets can take both 50 and 60 Hertz Vs.

Maybe you should try to find an RGB monitor? The ones that work with the Amiga also work with the Atari. Philips has produced some nice 14" monitors that can accept all kinds of signals, RGB, Composite video, Mono sound, stereo sound. They work with Ataris, Amigas, C64s, videorecorders, and can also display CGA with some additional electronics (one transistor and some resistors). The Philips monitor was sold rebadged under the names Commodore and Atari and maybe some other brand names too.

looking at this My news prg OE5 doesn't remove any when quoting, it inserts
the "--" on it's own.
I have manually added "-- " to the beginning of my sig,see if it works.

Fran�ois,

I have been in touch with Ricoh here in Britain about their
DVD player/CD-rw.

They tell me that the MP-9060 drive is compatible with the
MMC-2 commands, the reason being that the drive was designed
last October when the MMC-3 commands were only in draft form.

So potentially the drive might work with CD-Lab but as you
say "backward-compatible" isn't always what it seems.

Bye for now,

Peter S.

It probably would, but I can't guarantee. Mine works happily in both 50 and 60Hz. I have the feeling a modern TV might also be able to cope with the frequency too. Most electronic hardware nowadays is built with multi-standards in mind for cost reduction reasons. Even the latest cheap VCRs around here are now dealing with NTSC, when only a couple of years ago you had to pay an extra just to have PAL and SECAM.

So, maybe you could try it out on a new TV. If it does work, I'm pretty sure it'll work on an SC1224, 1225 or 1425.

... I remember this fault back -90 when I got it on my old SM124. It
was trivial to fix (a simple resistor or capacitor) but I of course
don't remember which ... anyone?

(Fault description: No hsync :) "horisontal lines slightly diagonal
all over the screen" that is ...)

Thankful for any help. As soon as I've fixed that I have a SM124 for
sale ;)

Is there a way to record and read back cassette programs as sound files? I thought I saw something posted once about this.

Hi all...

There used to be a company called 'Happy Computing' they released a cartridge for the ST range
of computers that could copy heavy protected disks!

I wonder if somebody knows wich version of the software that vas last released..
And if somebody has som technical indeep information I would like to know that to..

I think the name of the guy who started Happy computing was Mike Adams a brother to Scott Adams who started the company Adventure International..

Do anybody know what he is up to this days?

Regards!

Freddie

I've never came across 'Happy Computing' but 'Power Computing' made a
cartridge called the 'Ultimate Ripper' which would allow you to look
inside any program and remove protection, or change the program or copy
it to a different disk, and a bunch of other things......

Later, Donner.....

You could always fool the machine into thinking its chips are removed. Find
the Chip select pin on the host's ROM chips and connect to +5V.

Yes but i need much detail on the memory configuration :
- Is there a magic number (which one)?
- I think there's a "FAT". How to make this "FAT" (the description of the pointer in
  the rom where are the differents file name? where are the data of these files.....)?

Is there a web page who describes this?

Thank you very much

The LONG appearing at 0xFA0000 describes the type of cartridge:

0xABCDEF42 = application.

More info in the Atari Compendium, page 5.7 and 5.8.

Well, monochrome modes don't slow down the Falcon that much, even in enhanced resulutions.

Videl Inside, on versions earlier than the 2.00, was brought with
preselected modes for SM124/SM144 monitors, enhancing the screen res to
resolutions like 768x512 and even higher ones.

If you can't find it, I may try to get it for you. It still should be in
my archives ! :)

Please e-mail me if you're interested.

I may have been drunk when I wrote this post :)

I don't know why I understood you were talking about monochrome monitors.

For color monitors, the best solution is Videl Inside 2.

I've tried Screenblaster. With Afterburner it's not too bad.
I did find that when I use it with CAB or Newsie then I get a lot of

disk errors, on both IDE & SCSI HD's. Haven't sorted this out yet.

I believe the SM124 is essentially a VGA mono monitor. I'm not sure whether it will work at 71 Hz to give less flicker the way my SM124 does.

>>use a SVGA-screen for my Falcon?
>>
>>You may be able to get higher resolutions with it.
>So I do not need a screen-card fitted in my Falcon for
>achieving higher resolution than 640*480?

I'm not sure, as my Falcon has a Nemesis accelerator and Videlity, though I can't use these with the mono or RGB monitors. On the mono I can only get ST High but on the RGB color monitor I can get a lot more, though interlaced and with some flicker. This is a limitation of the monitor, which is basically designed to use TV frequencies (15-dd kHz horizontal, 50 or 60 Hz vrtical). On an SVGA you can go higher in progressive scan mode, but without lugging the beast out from its hiding place I can't tell you how much. Sorry. Just try it and see - you shouldn't do any damage as long as you switch off within a few seconds if the monitor doesn't lock up to the signal.

Regards, /Peter/

There is software that can do this for you. A special RAM-disk arranges the files you want inside the cartridge ROM:s. The software comes as a part of the Junior Prommer from Maxon in Germany. The cartridge ROM memory limit is 128Kb, which isn't enough for anything useable really.

On the STE you can have additional ROM:s for up to 512Kb of storage. This address space is right above the STE TOS and has nothing to do with the cartridge ROM:s. Physically this ROM container can be realized by piggybacking the STE's TOS ROMs with additional EPROM:s and adding an AND gate. The STBook has such a container built in.

Also ST's with added TOS 2.06 decoding hardware can accomplish this, here you're more or less free to decide for yourself how great a ROM you'd like. One Mb is possible for instance.

In most cases a harddisk is the better alternative.

FWIW, there are now new IDE interfaced Flash-ROM:s which can be plugged in to an existing IDE connector and behave like any ordinary harddrive. According to the salespeople these flash devices can be "formatted" and "partitioned" just like any other harddisks. Haven't had the opportunity to try one out myself yet. The downside is the price, but that may change in the future. Maybe Uwe Seimet can fill us in more on the feasibilities of this on the Atari side?

I recently found some information about a Ricoh DVD drive that can also write CD-RW disks. I've been looking at getting a CD-RW for my Milan but this looks like a better solution.

I expect that HD-Driver wouldn't have any problems but I don't know about Spin and CD writer software.

The drive is a Ricoh MP 9060A and info can be found on the ricoh web site.

Hi All,

Since I got my Milan I have been playing with video editors. The first one was TNT's Mountain which has always been very compatible with the Milan and NAES. Sadly it has no support for sound.

More recently I have been looking at Funmedia which until recently didn't work very well on my Milan.

Mountian http://perso.club-internet.fr/vanel/
Funmedia http://www.dpl.net/user/dpl-00777/

These two apps look very similar and are both good.

I would like to be able to do some basic editing of camcorder sourced video material. I have a digital camcorder so the obvious way of getting the footage into the Milan is through an IEEE1394 "firewire" interface rather than the more traditional video digitiser.

I have brought this topic up before on this NG and I know there are a few others out there like me.

The price of firewire pc cards has been falling and here in Great Britain cards like the one from SIIG can be obtained for about 150 quid.

I think that a fast 68060 machine would be needed (Hades and soon the Milan II hopefully) as well as a fast hard drive but aren't they all fast these days ?

The problem is that software drivers would be needed to talk to the card and to drive the camcorder. I contacted a couple of IEEE1394 card manufacturers about a year ago and once I managed to make them understand that I wasn't using a PC (they kept trying to sell me the PC software!) they were not very helpful. One did offer me the developers pack for writing tools for their driver but it was for a ridiculous sum of money. Why is it so expensive ?!

Does anyone feel like taking up the challenge ?

Regards,

Peter

PS> aren't they all fast these days ?
The speed of a fast drive is not your problem, the speed of editing is.

Video editing is handled with highly compressed MPEG2 today (the also compressed, but much bigger DV format - your camcorder produce that - takes a huge amount of RAM and HD space) and the Milan (or Milan II) is not nearly as fast enough for that. Even fast PCs, which are *incredibly much* faster than a 68060 computer, are just fast enough to decode MPEG2 in real-time. To encode the data, hardware MPEG2 encoders were used.

So you need a firewire card and a MPEG encoder card. And if you have them, you need drivers for them and if you have the drivers, you need MPEG2 editing software. The software is not existing and, I suppose, won't be written for that machine ...

I can answer you about CD writer software. Normally, DVD drives understand the MMC-2 (multimedia commands) command set, which, I think, are backward-compatible with the MMC-1 one, which is used on CD-RW drives. The problem is what "backward-compatible" really stands for, because as all developers know, things never work the way you would like them to :)

The CD recording tool I am developing supports MMC-1 commands, so it might be able to work with the DVD/CD-RW drive. But I can't promise anything.

bye,

1) There are so few developers out there (even in the PC world).

2) Developers are supposed to be able to pass on the costs to their customers.

I remember paying Global Engineering Documents $75 for an 18 page report which turned out to be useless.

>

� Hola a todos:

>
> Desde hace unos d�as estoy buscando la forma de ganar dinero en
> Internet, he recorrido grupos de noticias, tablones, avisos
> clasificados...
> En todos estos lugares encuentro mensajes como el que reproduzco m�s
> abajo.
> Me qued� pensando: Es simplemente una cadena, esto es algo que no
> anda...
> �y si funciona?. Esto no es algo nuevo, ya se hace desde d�cadas y no s�
> de nadie que haya hecho dinero... Y si funciona?. Pens�ndolo bien es un
> verdadero trabajo... �y si funciona?...Al final me decid� y aqu� estoy.
> Si tu tambi�n te decidiste o estas dudando, sigue leyendo.
> No creas que va a ser f�cil, es necesario colocar este mensaje en todos
> los lugares que se te ocurra publicarlo, news, tablones, avisos
> clasificados, etc. cuando mayor sea la cantidad de veces que lo repitas
> mejor para ti (y para mi por supuesto, ya ver�s) por eso te digo que es
> un verdadero trabajo, te va llevar varias horas, va requerir de toda tu
> experiencia, tambi�n va a depender de tu constancia para seguir
> publicando y tu habilidad para promocionarlo (pero no te preocupes). La
> diferencia con lo que se hac�a antes con el correo tradicional es que
> esta cadena no depende de cinco o diez personas a las que les llega el
> mensaje, sino que es para todo el mundo, y en Internet hay miles de
> personas que ver�n el aviso y alguna (como yo) se va a decidir.
> Y por �ltimo �Has pensado cu�nto puedes aprender en una tarea como
> esta, para aplicarla en trabajos futuros?
> Yo soy ahora el �ltimo de la lista que vas a encontrar y donde (si
> sigues adelante) vas a estar tu al repetir el mensaje, dej�ndome
> pen�ltimo, te deseo suerte, ya que tambi�n parte de esta suerte va a ser
> para m�.
> Este es el mensaje que encontr�:
> (NO ME HAGO CARGO DE LAS FALTAS DE ORTOGRAFIA DE LO QUE SIGUE):
> Esto es lo que le pas� a un amigo:
> D�as atr�s, cuando navegaba por estas p�ginas de Noticias, as� mismo
> como Ud. lo esta haciendo ahora, se me apareci� un art�culo similar a
> este que dec�a que uno puede ganar miles de d�lares en pocas semanas con
> una inversion de $6.00!. Enseguida pens�, Oh no! otra estafa mas?, pero
> como la mayoria de nosotros, la curiosidad pudo mas, y segu� leyendo.
> Segu�a diciendo que Ud. enviar� $1.00 a cada uno de los 6 nombres y
> direcciones mencionados en este art�culo. Entonces Ud. anota su nombre y
> direcci�n al final de la lista reemplazando al #6, y envie o ponga este
> art�culo a por lo menos 200 newsgroups(Hay miles de estos en todo
> elmundo).

> No hay truco, eso fue todo. La gran diferencia entre este sistema y
> otros es que Ud. tiene una lista de 6 en vez de 5... Esto significa que
> su promedio de ganancia sera aproximadamente 15 veces mayor!!! Despu�s
> de pensarlo una y otra vez, y consultar con unos amigos primero, decid�
> probarlo. Pens� que lo �nico que podria perder eran 6 estampillas
> (sellos de correos) y $6.00, verdad?.
> Como probablemente muchos de nosotros, estaba un poco preocupado por la
> legalidad de todo esto. Entonces investigu� en la ley internacional de
> Correos Internacionales de Am�rica y observe que en el articulo 4� dice
> que en este tipo de sistema de traslados de dinero en cantidades m�nimas
> era absolutamente legal.
> Entonces invert� mis $6.00......IMAGINENSE QUE!!!...a los 7 d�as,
> empec� a recibir dinero por correo!!!. Estaba sorprendido! Todavia
> pensaba que esto terminar�a enseguida, y no pens� mas en otra cosa. Pero
> el dinero seguia llegando. En mi primera semana hice unos $20.00 a
> $30.00 d�lares. Para el final de la segunda semana tenia hecho un total
> de m�s de $1,000.00!!!!! En la tercer semana recib� m�s de $10,000.00 y
> todavia seguia llegando m�s. Esta es mi cuarta semana ya hice un total
> de m�s de $41,000.00 y esto sigue llegando m�s rapidamente (mi esposa e
> hijos se pasan abriendo los sobres y yo consiguiendo Newsgroup). Esto se
> puso serio!!!! Todo esto realmente vali� la inversi�n de $6.00 y 6
> estampillas (sellos). Me gastaba m�s que esto en sorteos y loterias!!
> Perm�tanme explicarles como funciona esto y lo mas importante el porqu�
> funciona....tambi�n, Ud. aseg�rese de imprimir una copia de este
> art�culo AHORA, para poder sacar toda la informaci�n a medida que lo
> necesite.
> El proceso es muy facil y consiste en 3 pasos sencillos:
> PASO No. 1:
> Obtenga 6 hojas de papel y escriba en cada una de ellas FAVOR DE
> INCLUIRME EN SU LISTA DE CORRESPONDENCIA O E-MAIL. Ahora consiga 6
> billetes de US$1.00 dolar e introduzca cada dolar en un sobre con la
> hoja de manera que el billete no se vea a trav�s del sobre!!
> Mejor ponerlo encerrado en un papel de color oscuro para prevenir robos
> de correspondencia. Ahora Ud. deberia tener 6 sobres sellados y en ellos

I have 2 SF354 floppy drives for my 520ST. One of them still works perfectly fine.

The other, however, is getting power, but doesn't seem to spin at all.

My assumption is that there is probably a belt in the drive that either came off or snapped, or is stretched or something.

I opened op the Atari casing, to find the internal floppy drive assembly. Unfortunately, no drive mechanism or belt was accessible. I messed with trying to open the internal drive case itself, but I didn't want to force anything that wasn't supposed to be opened.

I am hoping that somebody can walk me through this and let me know how to get to the portion of the drive I need to access. Or, maybe this is symptomatic of another problem that has a well-known fix.

Finally, is there somewhere that I could just get a cheap replacement for the internal drive that would just plug right up to the power and controller card in the SF354 case? I'd rather just fix the one I have, but this may be a last resort.

Here are the specs of the drive (since I know they vary widely):
SF354
Serial #: A1645010549
Made in Taiwan
FCC ID: EBA72RSF354
It's the SF354 model where the red light in the front is on the lower right corner, and the disk slot / eject button are "slanted" to match the esthetics of the ST computer.

Let me know if you may be able to help me out. If there are other details about the drive needed to make a diagnosis, let me know and I will provide.

Thanks in advance to anybody who can help!

-Eric

Hello,

I search of documentation on the structures of file RSC. I created a program to extract the icones from 2 to 256 colors of the files Windows ICO and CUR (files DLL, EXE and OCX in progress). I would like to record them in a file RSC with format CICON. The documentation which I have (Compendium, Atari developor divides into volumes 1 and 2) are a little light on this subject. I saw well the structure RSHDR in PURE C, but no documentation on the pointers of objects. I believed to understand that there was a file RSCREATE.C which would seem well to answer my request. Can you help me to find it. Thank you by advance.

I did it!
With a Daewoo cmc1427X1 svga monitor.
Got CRISP B & W picture.

I haven't tried any colour res's yet tho.

While I'm at it... Anyone know how to make a SC1224 take a composite from a
vcr?
I cant see it being very hard.
I'm going to use a few of these for a project if it
can be done without worry

You need NTSC decoder for it. It's not too complicated with today's chips, but only experienced electronicer can make it. Perhaps you can buy it somewhere... But you will still need connectors.

I wouldn't bother repairing such an old drive. Besides, these are the single sided ones too, right? If I were you I'd just replace the mechanism with a modern PC drive. You'll need some fiddling with solder pads or something, but they're only 25EUR nowadays. There's a section about this in the Quick FAQ, mainly for STF internal floppies, but it can probably be adapted to external drives.

A PS2 mouse is just a rewired serial mouse, right? If so then you there is info about these in the Quick FAQ.

PS2 mouse uses different voltage levels than serial mouse. It works at standard 5V , while serial works at around -10V. However A4 Tech sales their PS/2 mouses with some adapter, so they can be attached to serial port.

I didn't think MPEG2 was used on mini-DV. I know it is used on DVD
but that is another story. Mini-DV has a much higher capacity than
a DVD and only stores 60mins of video. Also the data could be
uncompressed (slightly) before editing is attempted.

>So you need a firewire card and a MPEG encoder card. And if you have them,
>you need drivers for them and if you have the drivers, you need MPEG2

Once the edit is complete the data could be recompressed back to
mini-DV format at leisure before being re-written to a tape.
A hardware encoder might make things faster and without one it would
be annoying if the edit didn't turn out how you wanted it but that
happens with ordinary tape-to-tape editing.

>The software is not existing and, I suppose, won't be written

>for that machine ...

I assume you haven't seen Funmedia or Mountain then.

Firewire drivers have more uses than video though. Has anyone
seen the project to create drivers for Linux. I wonder if they
could be ported to Mint ?

Not true. PS2 mouse uses different voltages (TTL) and different communication protocol than
COMport mouse. In fact, PS2 mouse behaves almost exactly the same as the standard keyboard.
Some mices have smarter controller chip which can do both protocols, but definitely not all.
My old Logitech Pilot for serial port does not like PS/2 adapter...
In order to properly connect PS/2 mice to ATARI ST one would have to redesign interface.
If one chooses to use for the job microcontroller like PIC16F84 then it would be quite simple
to do the PCB board for it, and only headache would be writing the machine code for the microcontroller.

Regards,

Branko.

well I just got my falcon back after 3 weeks and 600.00 of investing and
I it doesn't work!!! what the CRAP! It wont run but two programs one
of which I access the Internet (stalker 3) and imagecopy!
OH YAHOO!!!!!!
if anyone has any knowledge on why Im getting
"internal checksum of calamus is no longer correct" from
my scsi and my ide and my floppy drive please let me know
YES thats write I can't even boot calamus 98 from my floppy drive.
Its time to take the lousiest computer Ive ever used and throw this
1200.00 piece right into the trash!!!!! Im so sick of IT I CANT TAKE
IT ANYMORE!!!!! AAAHAHAHAHAHAHAHA
SOMEONE HELP ME BEFORE I USE IT TO KEEP MY TIRES ON MY CARE FROM GETTING
DIRTY.

AHH THAT FELT ALOT BETTER!

now if anyone can offer theyre services for a lont time die hard atari
fan please offer advice. Im seeking the help of two right now
steve at wizztronics and a gentlemen named phantomm.

but all advice is welcome

thank you for putting up with my smack!!!

A simple suggestion is to get MouseBuster from A.S.P which will save you
time and money. At present I use one for my ATARI TT030 with a Touch
Pad.
The email address for A.S.P. is chrisc@zetnet.co.uk

Hi Gene,

Why not asking Centek, or Rodolphe Czuba for help? After all, it was they who made the upgrade? Calamus98 you say? I have it for PC myself. Did you check if it needs patching? Maybe that would help?

I have a couple of friends with CT2:s, they've all fought long and well to get to grips with the CT2, but it seem to work for them now. An adjustment here, a patch there, and soon all wrinkles are straightened out.

How much is a MouseBuster? So it connects a PS2 mouse to the Atari
mouse port?

Hi,

I can imagine pretty well how you feel. Mine quit work shortly
after I received it, but I'm pretty sure it was my fault ( ruining
something when I installed a 3.5" IDE HD ). So I sent my Falcon to
Rodolphe Czuba who is repairing it right now so hopefully it will
be usable again soon.
It's worth not giving up. Working with CT2 in turbo mode really
feels great.
Since I don't have Calamus I don't know whether it needs patching.
Maybe you find something at the CENTEK homepage.
BTW one thing I did very soon after receiving my CT2 was deactivating
Cecile and install the latest HDDRIVER instead.

True it seems a long away about a problem of rewiring, but when you come
to replacing a mouse which will happen (Oh! it's does happen). You will
have easier time in just buying a mouse. I hope this will help. keep
Atarianing.

Really? 99% of the serial mice I've seen came with a PS/2 adapter.

  Perhaps in France... But in my land not, certainly.
  Btrw. did you try that rewiring ?
However whole discussion is pretty nonsense, because you can buy serial
mouse for really low price.
I hope that even in Canada & France :-).

Hi there,
anyone any tips on how to share an SLM 605.
I'v got a TT030 and a Mega STE.
It would be (more than) nice to use the laserprinter without having to
switch cables (and reboot)...

Thanks for any tips...

Hi!

I was just given a Mustek 600 II CD scanner for free. We no longer needed it at work.

I know it runs with a SCSI interface-that is how it was connected to the PC at work. I notice three ports on this:

A SCSI 2 port
A SCSI 1 port
An appletalk port? Could I connect this instead of SCSI?

I have no manual, so I am out of luck there. I want this to work with my Falcon030. So, any help, software, drivers, etc. Would be most appreciated.

I also see the SCSI ID selector on the back.

Regards,

Jim W. Krych

I should clarify this by saying that the adapter is for *serial* mice. Many but *not all* PS/2 mice can be adapted to become a serial mouse with a small adapter.

If I had time I would make a new PS/2 to Atari mouse adapter, but I don't have time at the moment.

My trusty 10 year old STacy hard drive now can't boot. The HD activity
light just stays on when I turn on the computer.

I tried the Atari Advanced Hard Disk Utility (HDX.PRG) that came with the Stacy and upon trying to reformat the drive to Stacy/CH3021 or CH3042 settings, I get a fatal error and a recommendation to test the connections to the hard drive--which means that I'll have to open her up. I just don't see how things could have gotten loose inside since when it stopped working, I hadn't moved the laptop.

The funny thing is my FAST ICD drive that I've also been using with the Stacy stopped working tonight, too. The Stacy normally boots from its internal then looks for external drives. I would have expected it to go to the external drive once it realizes that it can't boot from the internal. I verified that the ICD drive no longer works by trying to boot it from my Mega4; that used to work--I had boot info on the ICD and I just tried the bootup tonight. But then it stopped.

Any helpful hints would be appreciated.

I don't really know how it works, but I have one internal device (HD)
and two external devices (HD, CD-ROM) and all work in harmony since I
figured the proper termination scheme (only the last device terminated).

Salu2!

Go to the site : http://www.whalley.demon.co.uk/atari/y2k.html
and look around, or get the file 'y2k_fix.zip' from that site and
install it in your auto folder. There is another patch file called
y2kpatch that you can use but, I found it to be a little more 'fussy'.
(It wouldn't install with other patches in the auto folder) You also
need to run a file called trapper before the y2kpatch to get it to work.

The y2k_fix file is run by itself.. You can then set the correct date.

I've worked for years with a "Y" and have to say the contrary.
As long as I had NO "Y" burning an audio CD did never work.
Since I changed it to a "Y" (two internal HD one one side, CD-Writer
and Scanner on the other side) I never had any trouble again.

Yep, fine. I don�t knew anything about SCSI chain in case of your
machine.

What i saw here some years ago was devinitly an "Y" SCSI bus. SCSI chip
on board was bad, user connect an external ZIP device simple.
A result of an "Y"

I removed SCSI chip an correct bus like this:

```
T Falcon   Device  Device     external Devices
#-######---######--######----->>               Terminator
```

T= Terminated

Before, with the death SCSI chip i found this in case:

```
(internal)
T  Device   Falcon   external ZIP
#-#######---######---######## -->> Terminator
```

Watch you SCSI chip :)

An "Y" bus do not exist on SCSI specification.

If that bus use short cables maybee it will work..
But put your finger on top of scsi chip if all devices are active!

Regards, Robert

I have had the same problem. But I found a patch that helped me. At first it

did not work, but when I finally understood I could not set my clock with
Magic and read the instruction file I found the solution:
Use our ordinary program for setting the cartridge clock to 1980! (Yes!) And
so use the patch in your AUTO-directory. Then all is OK!

That file is on the same site I listed earlier. It's called
'clockpch.prg'
You set your cart. clock for the current date, but the year is set for
1980.The

patch (when run) then sets the year 20 years later which makes the current clock time correct. This procedure works on a ICD clock as well as a cartridge.

Might still be able to... Got the PC source code, but no Atari ST source code... Bummed. And the guy who was credited with the original Atari ST source code doesn't have e-mail in the same place. So that was a no go.

I don't know all about the Falcon, but I would not have thought that there
would be a problem with such a configuration.

It seems to me that in the Falcon the SCSI chain could be depicted as one
continuous line, with internal devices towards one end, external devices
towards the other end and the Falcon itself in the middle. Provided that
there is termination at each end of the chain and the wires leading to
each device are shorter than the maximum 10 cm stub length, which as far
as I can see they would be, there should be no problem.

 Does antone know how I can copy my old '33' and '45' on to CD's.
What software will I need to sample them, some might need to be cleaned
up as they are a bit old, then write them to CD, them be able to be
played a music CD player?
  I have a STe (veloce) and a Falcon, hoping to get a CD re-writer as
soon as I drop on one at the right price.
Whers the best place to get whats needed?
Thanks for any help.
Karl

Yes, that -can- work, must not. SCSI Bus in form like "Y" doasn�t exist.
Noboday gaves a guarantee all devices are working well.
Falcon in "middle" position is ok if one of the ports are open. Maybee
it will work if the second port is connected with a realy short cable.
But isn�t OK for the SCSI Chip.

Regards, Robert

: Yes, that -can- work, must not. SCSI Bus in form like "Y" doasn�t
exist.

No it doesn't. The bus you're talking about has it's controller in the
middle which still makes it a straight bus.

```
outer                   internal
connector   F030        connector
||-----------||------------||
```

The physical ends of the bus are the ones to be terminated, which in the
above example would mean:

```
outer                   internal
connector   F030        connector
||-----------||------------||
T          (no T)           T
```

The outer SCSI connector on the Falcon should be plugged with a male termination plug, the internal connector with resistors or jumpers on the device itself. If there exists an external device, the termination on that end should either be provided by resistors/jumpers on the device or with a plug in the extra contact in the casing.

SCSI chains can be a real pain if you often attach/detach units. For devices in their own casing an external plug seems to be the most sensible arrangement.

The main principle in terminating SCSI busses is that the two *physical* ends of the bus must be terminated, and nothing else. SCSI ID:s must be exclusive (only one of each number), but don't have to be arranged in any special order.

Say that you'd want to add an external harddisk to the setup above. This is your friend's harddisk and you'll make a temporary dump of the contents of your internal Falcon drive to his drive.

First you'd enquire about the termination on his drive. Is there an external plug in the casing? Or is his drive terminated internally with SIL resistors? If yes on any of the above you simply unplug the external terminator in your Falcon and plug his harddisk in.

If there are no terminators whatever, you should try to supply some. Maybe the plug you have fits into his casing? Maybe you were foreseeing this possibility and in advance bought some resistors, which are cheap, or you could attach another terminated drive (physically) after his, which would also solve the problem.

What they do is to remove the termination resistors on the motherboard and solder some pins for a non-standard connector. Making the connection like that produces what Robert calls the "Y". I would guess it depends on what cable is the longest as to which device you terminate, internal or external, but surely not both. That would be like terminating each drive connected to the external SCSI connector they way the MK-X is setup.

Hi

I'm after info for the above hard drive: another Atarian has bought a so called working drive and can't get any life from it, hence I'm trying to sort it out for him.

What sort of hard drive mech is it: SCSI, MFM, RLL...

The drive inside it does not have the standard SCSI connector, but an 40-pin IDE type connector.

The drive spins up, when powered and goes through the usual motions when NO interface cable is connected. When the cable is attached and powered up it does bugger all except spin up, there is no motor or movement detected.

Using HD driver and ICD's ID check it pauses for 4-5 minutes when it comes to the ID it supposed to be!

Also, although unlikely, I wondered if the drive uses SPECIFIC software to access the drive!!!

The manual doesn't give very much info on it at all.

Any help will be more than appreciated and

```

Greetings to all,
My 4M STe works wonderfully with one exception: My hard drives' FATs regularly become corrupt and unreadable. Usually the problems start small with lost clusters that are (seemingly) repairable. The problems always increase to the point that read and write operations are impossible and repartitioning/reformatting is necessary. This has been a problem with this STe since I started using HD's with it (~10 yrs. ago.) Lately, the problems seem to begin with read and write problems immediately after starting with a "fresh" HD. Sometimes whole partitions start out being inaccessible! I remember reading some literature long ago about a chip that was used in STe's that caused a problem like this. HELP! Does anyone have any ideas as to what is happening? I'd rather not be doomed to using the STe by floppy alone. This occurs with new HD's as well as older ones, so I don't think it can be chalked up to aging HD media.

Thanks for 'listening',

mark

Hello!

I just write to tell that a VGA-screen is working fine at my Falcon.
(I have used a SM144 until today.)
And it boots at 640*480, not at ST-high as I have read about. I am using Magic.
Will it be anything better to use a SVGA-screen for my Falcon?

: Greetings to all,
: My 4M STe works wonderfully with one exception: My hard drives' FATs
: regularly become corrupt and unreadable.

A lot of STE:s have this problem. It appears to be due to a faulty DMA circuit. However, even if you swap the DMA for another one the problems may persist. On the other hand, I've swapped between a faulty STE's DMA and a good 520ST's. The result was that all of a sudden BOTH computer's disk handling worked flawlessly! I swapped back to original and the STE again behaved like yours.

A reliable test is to let the computer be switched on for about four hours, then try writing to the harddisk (preferably a long textfile or a picture), reboot and check out the file. If it shows signs of corruption, you still have the problem, if all is well, try writing more files, like copying whole partitions. You should check the file out before you start copying it!

A strange phenomena is also that some STE:s work well with harddisks for years, and then suddenly show this behaviour? Wearing and tearing inside the circuit?

Maybe the best bet here is to go for an IDE interface, it doesn't use the DMA at all.

Hi,

Perhaps someone with knowledge of the TOS ROMs could help me ?

Many years ago I fitted a TOS 2.06 upgrade board to my STfm.

Today I was looking through some old paperwork when I happened
upon the manual and fitting instructions.

The board is a Compo T_Board 64 that fits into a socket soldered
to the top of the 68000. The TOS 2.06 is activated by a small
program in the AUTO folder. When I switch on the ST it first
boots into TOS 1 then boots into TOS 2. I have it set-up so
that Superboot is activated before TOS 2. There is no hardware
switch with this board.

Looking at the back page of the installation instructions it says:

" If for some reason your original TOS has been removed from
  your computer it is still possible to fit T_BOARD. Just connect
  the solder point next to R1 on the T_BOARD to pin 20 of the
  first socket which contained one of your original TOS ROMS. "

I suddenly had the idea of fitting this wire so that the ST
will boot directly into TOS 2. Would this work without
first removing the soldered in TOS 1 chip set ?

If this would work it would then be tempting to fit a switch
into this circuit so that I could break the connection and
boot into TOS 1 if I needed to (unlikely).

I have a Milan and don't use my ST much anymore but it would
be better to use if it could boot straight into TOS 2.

Regards,

Peter

Have you tried another SCSI or ACSI cable? Or another host adaptor? Do
that before trying to change the drive chip - it's much easier!
IIRC the STE ACSI port probem was virtually permanent with the faulty
chip, but I guess it could get worse with time.

>I just write to tell that a VGA-screen is working fine at my Falcon.
>(I have used a SM144 until today.)

I have gone back to an SM124 for a lot of comms and text processing - I
find it gives a much clearer picture, specially when scrolling text.
VGA/SVGA in high colour resolutions is not only slower, but tends to
smear as it scrolls because different colour planes are handled
successively.

>And it boots at 640*480, not at ST-high as I have read about. I am using
>Magic.

What it boots into depends on the '#_DEV' numbers in MAGX.INF, but the

talk about 600*400 here was about *during* the boot phase, when the MagiC
logo appears unless you switch it off. I've added a '#' before the
'image=' and 'tiles=' lines, as this speeds up booting in some
resolutions because there is no need to dither the image to other than
256 or tiles to other than 16 colors.

>Will it be anything better to use a SVGA-screen for my Falcon?

You may be able to get higher resolutions with it.

Hello

I want to make a DISK ROM on the extension port of my falcon.
I know that i must connect 2 ROM, but i dont know how to programm it.
How the TOS do to detect the ROM?
How the TOS Do to know that it's many files wich can be access like a disk?

If someone have some informations, i'm very interrested.
Thank you

I suppose I also will use my SM144 instead of this new
big screen with characters snailing around.
Or perhaps using this VGA in ST-high will give almost
the same result as a SM144. I`ll try it out.

>use a SVGA-screen for my Falcon?
>

So I do not need a screen-card fitted in my Falcon for
achieving higher resolution than 640*480?

Try 16 colours, that gives you the best of both worlds. With that Nemesis
of yours and Videlity (or Centek's Centscreen) set up, you should be able
to get a nice display that's easy on the eyes.

No you can't.

Ghostlink is a program that allow the ST to access the PC's drives like it
was it's own, but:
- A 19.2Kbps serial connection is slower than a normal floppy drive
- It can read files, but can't run programs over the link.

> This seems to be the only real way to add a harddrive
> without trying to locate a old atari one.

No it isn't. You can connect modern IDE or SCSI drives as long as you have
an adapter. The adapters cost around 100 Euros or USD nowadays.

Check out the Quick FAQ.

> 2>I hook up my atari to a T.V. for color output but when i run "ste" only
> or enhanced software the screen goes haywire(like when u have your v-hold

> wrong). Is this suppose to happen??

No it isn't. Do you mean demos or programs using overscan? This might have to do with some 50/60Hz switching that your TV can't do. Not knowing in which part of the world does not help, because the 50/60Hz issue is related to your country's current.

You can get software which gives you higher resolutions (Blow Up, Videl, Screenblaster I think), but you'll find that the higher you go, the slower the system becomes. Any more than 640x480 VGA in 16 colours and the Falcon starts to slow down to the speed of an ST.

Still waiting for my Eclipse card from Coretex...

It does not, you must built a autofolder program, just like a RAM disk, but
without
write functions.

> How the TOS Do to know that it's many files wich can be access like a

You must fill the rom's with a standard filesystem.
The autofolderprogram will act as a devicedriver.

Hi!

I have noticed something with my VideoTurtle RGB to S-Video convertor. This is in regards to 50/60Hz.

On some demo programs that are fixed to 50Hz, I have noticed about a 1/6 of the screen is shifted down. Now mind you, this is on a 26" S-Video TV. And the 1CM135 monitor I have, doesn't show this at all.

But, I really am not troubled by it. The programs and demo's are still very usable and fun to watch, on the bigger screen especially.

Now, I am in the USA, and not a SCART user. I noticed the 50/60 Hz shift on a particular program, Lostblub, on the TV, via the VideoTurtle. I noticed the screen was down a bit from normal. I was perplexed until I had tried the Berzerk program from David Munsie, and did the 50/60Hz shift. Vola! There is the cause!

Is there a way to have these demo's to run in a 60Hz system, Falcon030, and the other ST's in my collection?

Regards,

Jim

I found some notes about the floppy disk controller chip, where certain ones are unsuitable for running high-density floppy drives, and are marked VL1772-02PC, WD1772 00-02, or WD1772 02PC. Ok ones are WD1772 02-02 or C302096-001A. Whether this would affect the hard drive as well, I don't know though!
Gary.

No, definitely not. Motorola switched from async to sync bus interfaces
starting with the MC68040, and they dropped the dynamic bus sizing feature.

This means you need a lot of glue logic - the afterburner card is basically
a 68040 upgrade with fastram for the falcon.

MC68040 and MC68060 are quite similar - *if* the developer of the 68040
board did some small things right, then dropping in a 68060 is easy (in
terms of not requiring additional logic): you need a 3.3V regulator and a
small delay for a clock line (as detailed in the MC68060 manual from
Motorola).

I wish:). As you say, A/B lacks several small circuits necessary for
the 060 to drop in.
I have a InterConnect Socket that provides the clock delay,
3.3V and a few other small nigets. The A/B uses the MI pin of the 040
for some sort of timing, but the 060 does not support the MI signal.
I have been able to emulate the MI signal with a truth gate. The IPL pins
```

function differently upon reset, and a bit of logic needs to be placed
there on the A/B as well. Still, it hasn't just "dropped" in and began
to work. While the machine will function under the Falcon
Diagnostic cartridge, there is a program counter error encountered
under one of the video test, but even the 040 does not perform all the
test properly. Without the diagnostic cart, the machine comes out of
reset, IDE spins up, and hangs there. There is no bus error, but I
haven't been able to locate where the problem is.
My messages in a bottle for help for the most part have gone un-noticed.
This is way over my head (not that it matters). The next bug in line
is code that may be incompatible with the 060, within the startup
sequence of TOS. I have a new ROM to burn, just need a little (LOT) help
with the assembly. TT-Digger is pretty cool! Last night I managed to
dump the files from the Diagnostic cartridge and have a look see by
inserting the cart after boot up (yea, big scare there). A bus
analizer would be a dream, along with some specifics about the logic
contained on the A/B itself. All of this work has made me apreciate
the work that went into my (non-working) CT2B.
Any help would be warmly received:)

Mike

That might be due to timing differences. The diagnostic cartridges from Atari tend to be *very* machine specific, which can make them fail on modified machines.

>This is way over my head (not that it matters). The next bug in line
>is code that may be incompatible with the 060, within the startup

Quite possibly. I had some such problems in the Milan TOS when I first booted with an '060, and that *although* I had already replaced all movep and some other stuff a long time ago. I remember that the MFP code used movep a lot.

Are you sure you are getting a bus error, and not some kind of unimplemented instruction trap (there are special 060 unimplemented instruction traps beside vector #4)?

I am afraid my current TOS won't be of much help, since I use a different compiler than Atari did, so I can't tell which parts in the original 4.04 binary may cause trouble on the 060 (most of these are easily removed by compiling TOS with -m68060 ;-)).

The Falcon had a special version of the 68030 chip that was not pin
compatible with a stock 68030 out of say a Mac or Amiga.
They were a special lot made for Atari and Moterilia won't discuss
them since they signed a non-disclosure agreement with ATari many
years ago. I know a guy who had tried replacing the chip on the
motherboard with a faster speed one since he had a accelerator board
on his falcon. It didn't work.

What 'code from the ROMS'?

I am quite sure that there are movep at least in the MFP code in the
(X)BIOS. Depending on the compiler used, there may also be other
unimplemented instructions (I had a problsm with a long division somewhere
in Gemdos).

>No, there is no bus error, and I can't find an indicator of why it hangs
>other than the unimplemented instruction suspect in TOS as startup.

Sounds reasonable. AFAIR, an original TOS does not hook into these vectors during startup, and even if it did, you would not get much besides bombs (provided the VDI is already initialized at that point).

>Urgg, another thing to tackel.... Since the MulitTOS AES can be boot
>off floppy, would it be possible to burn that into ROM just to get the
>machine up enough to load MiNT and NAES? I also have the -m060 assembler,
>so who knows, maybe I will get lucky:).

The first thing you can boot is the boot sector off a floppy - however, at that point (X)BIOS, VDI and Gemdos are already initialized, so any crash during the initialization will not get you there.

If the bootsector works, you have good chances that auto folder works, too - you can then put either a command.prg there, or start MiNT plus some AES.

The MultiTOS-AES can not be put in ROM easily, as it requires MiNT. Furthermore, you would gain nothing, since the crash happens much earlier than AES startup.

That is only partly true. It is a special 030 (with a OEM code instead of
the 'MC68030' label, and probably the unused data lines not connected inside
the case), *but* it definitely is pin-compatible with a normal MC68030 in
QFP case - I did replace the CPU in my falcon with a normal MC68030, and the
machine works just fine. Are you sure the guy mentioned above did not cause
some problem during the (de)soldering which made the machine fail?

I ran a surface mount PLCC 68EC030 on my Mighty Sonic and it worked fine
as well. It was off a Mac card. The Sparrow has an RC68030.

Mike

I have an Atari 1040st and a Atari SC1224 MONITER and a Atari S212 Modem

My question is can I get online with this ? If so how ? What do I need ?

Thanks in advance...

Alan

Is there really a difference between High Density PC type 1.44mb floppies which have the left read-write tab hole taped up and normal 720k Double-Sided Double-Density Disks?

I'm interested to know what your thoughts are. I have heard that the actual disks are different between High-density and Low-Density (hense the names I guess!?)

I have made a linear power supply for my Atari Falcon and it works fine and it is rock stable. Specs: 5V/7.5A, 2* 12V/ 330 mA each.
I was hoping this would reduce hum in my FA-8, and it did, but not as much as I expected.
Now I'm a bit puzzled how Atari actually designed the ground paths. There seems to be a AGND but as far as I can see it doesn't make much sense since the 5V and 12 V on the original PSU have common ground also, thus creating a ground loop (?).
I also noticed that the DSP port provides 12V and not 5 V as one would expect.
I have not checked this yet, but I'm pretty sure the FDI/FA8 have built in 5V regulators as well, so this makes not much sense either.

Now, my questions are: can I use the 5V of the linear PSU to feed the digital part of the FDI/FA8 and the 12 V for the analog part of them, then tying the two grounds together there (as it should) ?? Would this reduce hum ?
Also, can I disconnect the 12V to the audio subsystem, as I am not using it ??

Guido

About HD and DD:

On 4 Feb 2000 13:57:31 , Andrew Nielson wrote:

>names I guess!?)
>

It is not a question of putting more bits in a track (18 sectors
instead of 9) only.
With HD the bits have to leave the head in dubble frequency compared
to DD floppy. So the magnetic material has to have a better
resolution. (maller grains and that)
That means that writing bits needs more magnetic power to imprint
hem. Also technical thing as pre- and post- pre-magnetisation are
different.

A floppy drive that changes from DD to HD not only doubbles the frequentie for the bit I/O but also the timing and currents for generating magnetic fields and reading them.

The result is: if you fool the computer into thinking that a dd-disk is used and not a hd- disk then be not surprised to find your databits disappear after say 2 years because they were not 'punched in' forcefully enough.

Hi, I wrote quite a lot of text (about 280.000 words) on the Atari with "Word Plus"
My PC (Windows 98) won't read my Atari floppys, on the Atari I can't write on the PC formatted disk.
Both pretend disk formatted by the other system aren't formatted.
How can I save my work and transfer it to the PC?
Can anyone help?
Oliver.

Hello Oliver,

Given that you can't write to a PC disk, it sounds as though you may have a wonky disk drive in your Atari (perhaps drifted out of alignment or something?). It would be well worth trying some other pc formatted disks - you're sure you're using 720K disks, are you? i.e. regular density, NOT high density, is what you want. Can you connect your Atari to a modem, and perhaps transfer your file that way?

Good luck,
John

Hi.

I am just wondering what is the best brand/model SCSI HDD to install on
my STe. Also, is it worthwhile building my own adapter (from schematics
on the net..) or should i just buy one..?

thanx.

-Michael.

Hello,

if you are a HAM (Radio Amateur), still using/having a Atari ST computer
and you are interested in using highspeed (9k6) packet, but not want to
spend to much,
maybe this modem & driver is interesting solution for you.

Hardware & software where develloped by Chris - OE5DXL for Atari ST, it
uses/tricks the MFP chip.
(btw. there also is a version for PC)

Remark: The L2STX driver only supports hostmode packet-prgs.
(i just updated the page with a new version of SP - a update from Odo,
dl1xao)

I have build the Atari version a few years ago, and after it worked i have
sold my expensive 9k6
TNC ;-)
 (this modem costed me only 10$)

My website about OE5DXL modem/driver: http://www.qsl.net/pe1nib/

Hi John, thank you very much for your reply!
By regular density you mean DD instead of HD, right?
I read somewhere else that a PC floppy won't accept HD disks anymore.
I'll try anyway.

```
Thanx again for your help!!
Oliver.

I do not think so!
I have used my drill to make holes on appr. 50 DD-disks and used them for 1.44 on my Falcon and have had no trouble with them.
Even my Basf-disks that crashed a lot earlier when formatted for 720k, works fine formatted for 1.44!

So I think that those with a little mark (to show
whree to make the hole!) on the left side is just the
same inside as HD-disks.

Its only an idea I'm not sure if it will work, but try formatting the disk to a 720 on the PC. Type the following at the dos prompt it may just work.....

```
FORMAT A: /U /F:720
```

This should do an unconditional format to 720KB

Then save the work on the ST as TXT, to this disk

Hope this works, let me know how you get on

Cheers

I use an IBM DSAS-3540 (540MB) and I am quite pleased with it. I should mention however, that I had some initial set-up problems (would not boot without an additional reset because of an incorrect jumper position), and I found that it is rather picky regarding disk-driver settings (I use ICD driver). For example, with some values of "verify buffer" the driver would occasionaly report "write fail".

I use it with Ge-soft SCSI-2 host adaptor.

One of the things I like best on this drive is its extraordinary quietness- the fan on my Mega's power supply is louder than the disk.

Cu.

Now, if we could get these cards into a TT for a reasonable price, say under
$500. That would be something.

STill running in TT medium. (sigh)

>So I think that those with a little mark (to show
>whree to make the hole!) on the left side is just the
>same inside as HD-disks.

No they are certainly not the same inside.

Think about it!!! punching a hole to make the drive think it's a 1.44

disk! The 1.44 drives can WRITE and READ 720k (double density disks) AND 1.44 (high density disks). So it makes sense that if you punch a hole to use 720k (DD) disks as 1.44 (HD) disks they will work!!!

Now try and use a 1.44 disk as a double density in a double density drive and sooner or later, that's if your drive will read and format it, it will go bad!!

I still get people complaining of valuable data loss for using high density disks in their Atari's double density drives. What makes it worse is that most computer shops, including Curry, Dixon, Comet... (in the UK) still tell people that these, HD, are the only disks produced and will work with ANY computer!!!

By rights double density disk should be BETTER than high density, though I haven't really tested them in that sense. I suppose it's like 5.25" disks being more data secure than 3.5" ones!!

Yep, should work, a friend of mine had a Megafile 30 with a Link '97 +

Jaz drive hooked up to his STe and had no connection problems.

Hello again!

An answere to:

>Steve Stupple <Steve@atari.org>

>just the
>>same inside as HD-disks.
>
>No they are certainly not the same inside.

Are you quite sure that there was not produced disk with the same
magnetic plate inside HD and DD for a periode?
(When it still was quite common to use DD disks, but all new computers
used HD disks?)
If it were as I assume, it can explain why approx. 100 BASF DD-disk
crashed on the STs used at work some years ago and some of them now
works perfect when they are formatted for 1.44.
No proof, but.....

>So it makes sense that if you punch a hole to
>use 720k (DD) disks as 1.44 (HD) disks they will work!!!
Yes! And I can store up to 1.44K without any problem! Time will show
what happens in two years. Until now it works perfect. (No more

trouble than with original 1.44K capasity.)
I just now checked out 4 disks where I have stored ZIP-ed mail (not my
most valuable data!), and they are all still readable.

>sooner or later, that's if your drive will read and format it,
>it will go bad!!
It will do with all disks. (sooner or later!)

>I still get people complaining of valuable data loss for using high
>density disks in their Atari's double density drives.
Yes, that is my experience too! (As with the DD BASF-disks!)
So I, of course, agree that there are differces in the magnetic plates
inside the first DD-disks and the latest HD-disks.
I repeat my question:
Are you really sure there was not produced (for a periode) some disks
with different cover and the same inside?

I suppose it's possible in the early HD days, just like single and
double sided disks having the same media but label, and priced
differently.

>(When it still was quite common to use DD disks, but all new computers

Thinking back, I bought a few 3M DD disk a while back, and they weren't
very data secure at all, 75% went bad!! It makes you wonder!

Try Ebay they usually sell for about 5-10 . The ones sold are usually the original Atari adaptors.

There is a program to download the picture out of a Olympus digital camera. I beleive it works on a few other digital cameras. I have a Fuji MX1200 that has a cable to plug into a com port but havent tried out the software to see if it works with my camera. Your best bet would probably be the Sony camera since it saves the image to floppy disk. It uses a jpg format. I will post my findings with the Atari digital camera software as soon as I try it out. I think the software is in German.

>Do you have the SHDRIVER.SYS file, you could rename that to
>SHDRIVER.PRG
>and put that in the auto folder of a floppy!.

Thank you for the information! My Falcon refuses to boot from the SCSI-disk sometimes.
(The id for the disk is changing from 4 to 6 when the computer have been "bombing out", and then it always becomes impossible to boot from the hd until the power of the Falcon have been off for several minutes!).
Then I sometimes need a startup disk. Earlier it was a bit troublesome to get started from a disk as I had a hddriver.prg that expected an IDE-disk!

After I copied my hddriver.sys from the hd to the AUTO-folder on the disk
and renamed it, the disk is starting my hd quite quickly with magic
and all...

I would never get the idea to rename it if I did not find the
information here. (I am a bad reader of "users manual"!)

Thank you Steve!

Hi

I have an Atari ST 1040 FM With Mono Monitor and some Music Programs

 Price $ 100.oo   Pickup Only.

I also Service the Atari St range of computers.

Leave Email or Ring on 9 397 7695
Williamstown, Victoria, Australia

Yours Ray Whitehurst.

Gentlefolk!

I'm staring bemusedly at a Dixon's catalogue of digital cameras listing
28 different models. Not flush enough yet to 'invest', I am yet
interested the details, but (as usual) ignorant of the matter.

Would readers of this tech ng care to contribute their experiences
and thoughts about use of such cameras in relation to the Atari line
of comuters?

- Which work with ST, TT, Falcon, Hades....
- what software is needed ...
- what about the different storage media: which can be used with Atari...
- how many pics do the different media allow...
- how transfer pics to the computer...
- how to use on web pages ...
- etc etc....?

The late-lamented AC mag began articles about this, but... tragedy...

In hope,
Charles.

I didn't look far enough. I used TT Digger to look at TOS 4.04 and
found many movep's. It is used in Sparrow (2.07) TOS and on down the
line looking at the files using Hex_Edit. Interesting that the
diagnostic cart ROM does not contain one instance of movep.

I don't think were getting that far. The first movep in TOS 4.04 is on line 10. I think at that point it is setting up an address for the MFP, way before the necessary things I need are initialized. Looking at the Amiga Phase 5 site, they had the same problems with the 060 and some of the cards used on the bus that have ROMs with the movep code. They wrote a "movep emulator" in their code, but said it degraded performance quite a bit and recommended that the ROMs be upgraded. As the Falcon boots off the ROM, an emulator would do no good here.

What I would like to have is just enough code to get the machine to the auto folder. I don't really care about the AES or GEM on ROM, just get it to the auto folder for MiNT and NAES. I know this means always having to use a hard disk to get the machine up, but I have a couple of Falcons, so that is not a problem.
Wizztronics supposedly has the source code for TOS 4.04, but either Steve is full of it, or is hording it for some unknown (and likely never seen) idea. More likely the latter as the guy is pretty swift with it comes to the Falcon. Just wish he would let it go and get it over with.

Maybe I can get Katherine to take a shot at it. I don't think I was one of the users that ticked her off :)

Thanks Michael,

Mike

Right, Olympia is about $70.00 US and works with several different
cameras. I almost went for the Sony floppy, but the hi-end one is very
pricey, and the quality of the lo-end models images leave a lot to be
desired (slightly better than Computer Eyes:). The package is in
German only, AFAIK, but is sold through many of the larger German
Atari dealers.

I wouldn't say so. My recommendation is based on the fact that IBM SCSI
drives usually are reliable and they are not too expensive. This doesn't
mean, of course, that other drives are a bad choice.

Yes there is indeed and a demo is somewhere on the belgium ftp-site.
The name to look for is 'Olympia'

But: the program can do much more then downloading pictures from a
Olympus and alike camera.
It needs HSMOD, NVDI, CAB, MagiC, Olga, AV-server etc to be fully
functional. And only fully functional is possible.

Does this mean it wont work under plain TOS. I have the HSMOD and NVDI but the others I do not have. And since the docs are the only language I dont speak Greek. HEHEHEHE.(attempt at funny). I really was just going to play the hit and miss game with trying to get it to work.

Should work under MultiTOS.

Check chro_magic, BEST Electronics, and others listed at
http://www.tmisnet.com/~strads/hq/atari.html -- click on
"Dealers".

I know ... the web site is looking a tad old ... it will be spruced
up soon.

Kindest regards,
George Crissman

You can configure HDDRIVER.PRG exactly as you can do this with
HDDRIVER.SYS. Please refer to the manual.

Where are the screws to open the screen? Behind which label?

It should be possible for WordPad to open a file with the SDO
extension ... here's what I would do.

1. Start WordPad (Start, Programs, Accessories, WordPad).

2. Select "File", "Open" from the menu bar.

3. In the dialog, change "Files of Type" to "All Documents".
    Then change "File Name" to "*.SDO" -- remember to press ENTER.

4. Click on the SDO file of your choice, then click on "Open".

If this does not work, please let us know which step (above) fails!

It works but the text is under cover or not readable. The text starts with:
"sdoc0001" and continue with non recognizable symbols. When I try to copy
and paste it only "sdoc0001" appears. The reason might be in fact I did not

use standard fonts.

Aleksandar

IIRC there are only two screws, behind the Atari-logo at the bottom
left of the screen. The rest of the cover is snapped together.

You have to snake the white wires around the clamp to give you say another
inch or so. Now you can prop up the display vertically directly behind the
case.

Years ago I changed the regulator, hard drive and had to screw around with
the adspeed ICD installed for me (the chip pins had to be extended)

Btw, where did you find your replacement regulator board?

Mine's 12v part just gave up, which prevents the hard-disk from rolling (it worked for a few minutes, then something smelled like it was burning - the regulator presumably isn't strong enough for the new drive); the output goes down to 6v within one minute from booting. The floppy still works, though, fortunately.

A few years ago from Best Electronics. The regulator board is the weak link,mine started to die slowly with the adspeed and larger hard drive and if I had my Midex+ pluged in (midi and cart port expander) the Stacy wouldn't boot. Now if I can find an old text file there was a mod to get more power out. Give me some time, I'll have to fire up the Falcon to see if I have the file there.

```

Don't try to open them at all on the PC in any editor.

Do this:

1) See if you can find someone with SIGNUM still running on their ST (anywhere in the world) that agrees to do the conversion for you.

2) Write an E-mail to that person, and enclose the files in that E-mail as Attachments (you can attach any file of any type, even if the PC can't understand its contents).

3) The other person can save the attachments, use SIGNUM, and E-mail the

```
resulting text files back to you. Again as Attachments.

4) You will then be able to open the Attachments on your PC.

I'll get a chance either tonight or tomorrow and I'll do some digging. It was a fairly simple mod.

Shit I wish I could remember exactly, give me a day or two...I'll find it.

The text file was in the Genie Atari forum archives but I don't know if the files were saved when Genie sort of died.

Rich

Hey there people.

I just want to say a sincere THANKS! to all you folks for
keeping the Fuji alive!

You have all been an excellent resource since I got my STs
a couple weeks ago.
Project one was to connect it all up to a Daewoo 1428 SVGA monitor.

he resources out there were good except for one thing, the pinouts
were actually in reverse for themonitor jack on mine!
As you look at the jack, pin one seems to start on the right.

Anyways after MUCH experimenting, I got it to work, GREAT picture!

Just wondering one more thing... Can I connect this as a medium res,
color monitor too?
I intend on making a switchable ST -> Svga box with color/B&W option.

Anyone looking for monitors and the like? I found a source for a LOT
of Atari gear here locally, in a warehouse.
Probably 30 or 40 whole machines scattered throughout the place!
Getting my hands on a Mega ST(e?) or was it Mega ST(m?) Not sure.
Just wondering if it's possible to use another keyboard with this
unit... Seems as though the keyboard might be missing.
Thanks,
Noel

Thanks a million!
Noel

Pull the "Stacy 4" label from just below the screen. You will
find screws. Disassemble the top (screen part) of the computer
first and the wire harness will be quite a non-issue. (Learned
that trick from Alex Yu at ATY.)

Galen

Could anyone help with my question. It is this: I am a music producer with extreme sensitivity to timing fluctuations when using software-sequenced music via a computer. To my mind, and ears, the best and tightest system still to this day is the Atari with the built-in MID ports. Am I nuts, or is this true? I have arguements all the time with various artists and producers re: timing errors using Macs and PC systems, but only a few know what I'm talking about with the Atari. Occasionaly,

there is an article in a music- tech mag talking about the rock-solid
tightness of the
Atari. But other than that, I'm on my own defending the Atari. Can someone
please confirm or deny this, and if it is true, can someone say precicely
why. Other than the obvious, i.e. built-in MIDI, I know of no other reason.
Any help? Thanks, jay

Yes it is true,

Reasons: (I'm not an expert but here goes)

1 The OS is not multitasking
2 Midi is part of the OS (Atari was part of the original group which started
midi)

I got my Mac's timing close to the Atari's (Mac is running OMS) but it still
doesn't feel right all the time.

On PC's there are alot more system calls going on (BeOS gives priority to
multimedia calls, midi, audio) and midi is not a priority.

Cakewalk running under DOS I heard was very tight. (a good thing)

Hello!

I am seriously worried about my Falcon. After uprading from 4 to 14Mb
memory, my Falcon at first worked like before.
But now it had happened a several times that it seems dead when I am
starting it. No lights and just some ticking from it. When I am moving
it (shaking softly) it is starting and then works fine.
(I have checked out the contacts of the memory board!)
It seems like there is not enough power to get it started??

Can anyone help me before I am loosing all contact with the IN?

Hello!

>Can you tell us a little more info about your
>upgrade? e.g. What
>upgrade board did you use?, 72 pin SIMMS or 30 pin
>SIMMS?, etc.

Eh.. I can find this on the "Bedienungsanleitung":

WB Systemtechnik GmbH
Bahnhofstrasse 289, 44579 Castrop-Rauxel
The card is called a "PS/2-Module"

On the packet I find:

SM1632c6540OT-6G
64MB FPM 72pin SIMM Low
(My comment: 64MB?????, I just have got 14mB!!)

And the problem was:

>I am seriously worried about my Falcon. After
>uprading from 4 to 14Mb
>memory, my Falcon at first worked like before.
>But now it had happened a several times that it seems

I had a Falcon that did the same thing.Would make a ticking sound when trying to start. I would shut it off and turn it on again and it would be fine. My would also boot up fine then start ticking and I wouldnt be able to do anything except shut down. I spent about $3.00 and replaced the capacitors on the power supply and it never did it again. If you do remove your capacitors just remember which way they came out. I replaced them all but you will notice after you get the bad one off it will have leakage. The leakage will leave a water like mark with brown edges.

HI all atarians !

I have a vga <=> scart cable but it dosen�t work when i connect it to my
TV.
The picture is flimmering up and down.

Please can anyone tell me how to make this cable working for this,
or do i have to build my own, or bye another one.

I have the same problem with my Falcon MKII,
but with the RF cable it works but the sound don�t.

Thank you for your help.

The ticking from the Falcon is most likely due to the PSU starting up, finding a short circuit and powering down again. It will repeat this until you switch it off or remove the short.

Make absolutely sure that you have pushed the memory card firmly down onto the connectors on the motherboard - I've had exactly the same problem as you.

Thank you for answering me!

I have taken it out and pushed it as firmly down as I
dared. But you might be right as it starts when I am

twisting the whole computer gently! So I will try once
more taking it out and put it back again!

Quoting an article on "MIDI Timing Realities" by James Chung from Club
Cubase Magazine Vol. 8.4 1999:

"Let's face it Microsoft and Apple are not designing operating systems
for the sequencing community. It's the job of Steinberg programmers to
make the best of what they've got to work with.
The best computer timing is still on the Atari ST because the
programmers had direct access to the computer hardware and could bypass
the innocuous Atari TOS."

Imho really rather strange as modern pc's and Mac's have about 20-30
times the capacity in speed, RAM, HD space etc. The ST Chung is
thinking of may very well be an old 4MB 8MHz Atari with no harddisk and
just a single 720 floppy drive. Cubase Score keeps the timing perfect
on this setup, but to get faster screen response you might want a
faster TT at 32MHz with 1280*960 mono monitor.

Aaaarg..

Sure you insert new memory card well to ALL pins of the internal memory
port??

"Ticking" from the internal PSU says: short circuit between +5V and GND!
(The point if the machine doasn�t come up)

Othersides, that also sounds like bad solder poins on memory port
connector(s) .

Regards, Robert

It seems I am still out from nodelist, Peter can you check my connected areas
?

BTW the question is this: Applylst does not work as it seems to be affected
by the y2k bug, so it deletes my nodediffs as it recognizes them as "obsolete
difference file".

It it possible to get the Applylst sources or is there another software that
can do this ? Breakneck ?

It seems to me that this is the matter of, basically, a "REALTIME APPLICATION"; that is (more-less), the software must perform certain tasks and/or respond to external signals at exactly determined times and moments.
As far s I could see, including some experience from the place where I work, multitasking OS-es (i.e. MacOs, Windows, Linux) dont go very well with real-time applications, unless they are specifically designed for that purpose. Simply, with such OS-es you can never exactly know when will some piece of code be executed. On the other hand, with a simple single-task TOS, the programer can know and control what is happening in his machine at all times, down to a single CPU clock cycle. If an application makes some sort of internal multitasking, then it is still under its own control.

At the place where I work we had to make a PC-based real-time application to control a 100KHz/16-bit/64channel data acquisition system. Windows was briefly considered as the OS, as Windows NT boasts real-time capabilities; then, some inquiries showed that for it "in real time" is anywhere within about 0.5 seconds- not exactly right for a 100KHz application. It also turned out that Linux needed some kind of patch to the kernel to make it really real-time. Further inquiries and some tests showed that QNX would be the real thing- miniature, very fast, unix-like but not unix... and created specially for real-time purposes. Unfortunately, it is quite expensive- a development environment might cost several thousand dollars, and we did not have it in the house. As the application was needed quickly, the guys programmed it in plain MS-DOS, which is about as single-tasking and simple-minded as TOS, though lacking the GUI. So the data acquisition system now works happily, functional but without makeup, bells and whistles- and we decided to switch it to QNX with its "Photon" GUI, when we acquire the proper environment.

I started making music with my ST, worked great but for some resason I changed to PC, everything f*cked up, never worked, the music did not play "tight" especially when I used audiotracks with midi. So I changed back to my F030. The timing is a lot better, even when you use midi + 8-16 tracks audio. I think the timingproblems on the PC is not due to the PC itself, rather the OS.. Also - cubase on the PC has a lot more bugs, and crashes randomly. Quite a turn-off. But at least it is pretty to look at :-) (nice colors)

cheers

/Peter

Hi :)

I would like to create an international newsgroup (english language) based
only around discussions and thoughts about our Operating System evolution.
The purpose is to establish some specifications about new calls,
AES object structures or other. Any thoughts about functions, interface

possibility, function implementation will be welcome in this future
newsgroup. To participate in this newsgroup, no need to be a programer.
.
Just by telling what you would like to see on your Atari, or what you like
about other OS will be considered helpful. I want to create this newsgroup
about Atari OS because I think that no specific goal, no near future
vision is what stops our OS to move forward. If you wish to see such a
newsgroup, email me, I will take care of everything to implement it.

Lehmann Gaetan

I know there's a PC adaptor and software that'll allow you to use a
NES/Famicon Power Glove to control some kind of MIDI signals, does anyone
know of anything that's been ported to Atari? Thanks ahead.

You're not alone out there, although it may seem so when talking about Atari's. I'm a music producer and live performer using a mega ste for my solo-act.   I've been sequencing on Atari's since 1988 using the old Hybrid Arts Edit II Track software and have come to trust the program/timing without any hesitation-I don't have the time or patience for crashes in my line of work. Why is Atari the standard(IMHO) by which all others are measured?   Being technolgy-challenged in that area, I couldn't tell you..but I wouldn't step on stage with anything else!
happy motoring,
fcr

Please, if someone has old copy of Timeworks Data Manager
ST for sale, send to me e-mail. I have problem to convert
data and need that software.

Thanks
John

Hi,

Since my old Falcon doesn't work anymore and there's nobody
around who could repair it, I want to buy a replacement.
Can anyone tell me whether a MKX is worth its higher price ?
I don't need better AD/DA converters because I use JAMin and
MO4. What I would like to have is a more reliable SCSI
interface, and the rack sounds interesting too (if there are
all interfaces like in the original Falcon).

Gerhard

The MKX is a nice case, and adds a little more expansion room over a stock Falcon. Two full size IDE drives can be fit, or one IDE and a Graphics card (with a device on the expansion connector). The The CT2 and Afterburner fit well, but the low profile may not lend itself to the CT2's tempermental temperature tantrums. It makes for a very compact and trick looking setup, and the ability to utilize a TT or MSTE keyboard. One time I had a 3.5" HD, and an EZ 135 IDE drive fitted inside. If you don't tote your Falcon around a lot, a rack is really nice for fitting a much larger array of upgrades over the MK-X case. A Wizztronics rack, (on sale now) extends all of the standard Falcon connectors to easily accessable areas, less the reset button which still much be operated from the rear. (www.wizztronics.com)
I don't think you will find the SCSI on the C-Lab units any more reliable than any Falcon with the proper DMA buffer installed. Sans the Revision number (who knows what you will get) they are the same motherboard. The SCSI modification C-Lab does is (please excuse me) kind of a hack (but it works). It's only purpose is to allow an internal SCSI connector. Best to just loop a SCSI II cable from the Falcons connector back into one you can install yourself (the MK-X has some knock-outs)with no modifications necessary to the motherboard (C-Labs come modified anyway if you go that route, elimating the necessity for this method). That is how the Falcon Rack (Wizztronics) takes care of this problem. C-Lab also perform their own audio in/out mods and supply a .250" std interface on a small custom card mounted inside the MK-X. Picts are available in the Do it F030 archives.
Wizztronics gets around ~$150.00 U.S to repair a Falcon, shipping included. They are reliable and can perform any modifications you wish (except installing an 040:). There are a couple of other vendors that can trouble shoot and repair the machine (in the U.S.), but Wizztronics is best setup for R&R of SMPLCC stuff, which is usually the problem on a burned out Falcon (ie, COMBEL, VIDEL, DMA). For the repair price, and a decked out Falcon Rack, you will be way under the cost of a C-Lab machine. I guess it depends on who you want to do business with.
My 2cts

Mike

Not much of an answer, but I saw the docs somewhere while surfing the
Atari Web Ring. Have no idea where, but it was the (excellent) site that
contains a ton of software and hardware mods for TOS machines.

What�s the problem?

> Can anyone tell me whether a MKX is worth its higher price ?

Hm..
That�s what i mean..
These smal modification doasn�t allowed the price.

It�s the same falcon mainboard. SCSI isn�t avaiable not longer
external.. And they make modifications around analog audio also another
case.. that�s it ./
Can�t remeber me for some "goodies" more..
Please correct me if i�m wrong.

Regards, Robert

On the MKX the external SCSI II connector is still there, and works as
in the standard Falcon, in addition to the internal one.

In my opinion the biggest advantage of the MKX is the case, that is very
nice and robust, allowing internal 3.5 drives and CD-ROM to be
installed, besides a graphic card or accelerator. In addition, there are
special connectors for audio in and out, with big mono plugs instead of
the small stereo ones (there is a mod in the resistors, but I don't know
much about).
I have some SCSI lockups from time to time. Nothing serious but for
intense HD work like HD recording I guess is still recommended to
install the buffer mod. The external keyboard connector is definitively
a plus, allowing the connection of either a TT/MegaST or a PC keyboard
if you order it with that option.

All the best!

Daniel

Hi again,

Looking at the Antic article, Computereyes seems to be for the 8-bit
Atari range anyway.

Bob.

This is true. When doing MIDI the Atari is not doing anything. It is a small and simple system. When doing sequencing, a PC or a Mac is always multitasking, checking IRQs, leaving precious CPU cycles to screensavers, sound card drivers, virtual RAM swapping, anti-virus stuff, let alone a soft synth, hence the appalling real-time performance.

Are you sure it's a SM1202? It should be SM124, 125 or 144, but not 4
numbers.

Anyway, there's no way you'll get it run on a PC. It definitely won't take
composite. Donate it or sell it to an Atari owner who can use it. You could
get a cheap old VGA for the price.

You can't do this unless you monitor can sync down to the very low
frequencies needed for ST colour resolutions. These frequencies are in the
Quick FAQ at http://bales.online.fr/atari and I've yet to find a modern VGA
capable of doing this.

I just updated a file on my 1040 STe for the first time since new years
day & I put in 00 for the year as that's all it allowed me & TOS says the
file was last updated on 02-29-28! Is ther a Y2K fix for the ST's? I
don't like the idea of the dates of my files being all goofed up from now
on (I'm nowhere near through useing my ST).
   Later,
      JJH

In that case, yes it could be used as a video monitor, but only if you have
an RGB output. It cannot take a composite video input. It certainly won't
take a VGA input either, because it can only handle ~250 lines and 15MHz
horizontal frequency. I wouldn't like to see windows running in 640x200 ;-P

Hm, sounds like different cases around?
I saw one with an internal SCSI drive and an internal SCSI modification.

If you use the internal device and you like you add an external scsi
device you got an SCSI bus like an "Y"

Won�t work.

Only with internal or with external devices it works fine.

Regards, Robert

Oooops! bad move.

What type of file was/is it you lost? I may be able to help you but
chances aren't very good as important data may have been overwritten!

I don't think it was. I think something happened with one of the UK Newsfeeders. I saw alot of lonely UK posts and tests posts in the last few days, on various NG.

But things have kept on happening here at this end.

Brian.

Numerous SH204s, Megafiles etc, kicking around and attached to STs. I
download stuff on the TT, straight to the Megafiles, or SH204s, then
connect them to the STs. Therefore they become Portable HDs.
I also have GDOS fonts and other archived files on the MegaFiles, that I
may need to look at on the TT, along with Clipart and such, so I just
connect them and go.

Anyways, for testing, I both connect and disconnect the megafiles.
I just report what I see and go from there.

<snip> other info deleted until I do more testing.

Thanks for your help.

Brian.

Hi,

Not so long I got an Atari TT030 from a friend of mine. Another friend of me told me there are linux dists for the 68030 processor. So I repartioned the HD with a linux tool (atari-fdisk) and installed linux (Debian). But when it was almost completely installed I came to the conclusion that linux couldn't be placed in the boot sector of my Atari HD so it was neccesary to keep a little space on the harddrive for TOS/GEM. From this space I should be able to start a little program which boots linux.

I wasn't very happy, 'cause by now I knew I had to do the installation all over again. But okay, I like a challenge. So I took a little TOS/GEM utility I saved just before I repartioned my harddisk, called HDX. HDX formatted my harddisk and after that I used it to repartion my harddisk again. When I quit the program my Atari automaticly rebooted. When finished booting I came to the conclussion there still wasn't an harddisk present. Then I remembered I had another little utility which I somehow thougt would be capabele of making my HD usabele. This utility was called HINSTALL, but when I ran this program it told me there was no logical drive present. Can somebody please help me? I by now don't have clue anymore of how to make my harddisk work.

Thnx in advance, Mark

BTW please don't mind my bad English.

Run HINSTALL and select drive A as your boot disk, make sure you put a new floppy in the drive. This will add the harddrive booter to the floppy drive, one of the linux kernals (bootstrap) should also fit on that floppy.

This will boot you into gem and allow you to access any GEM partitions available. If their is no gem partition, run the linux bootstrap from the floppy and then check to see it all the partitions were linux.

When I run HINSTALL it says: 'No available logical drive for installation of driver' after this message it automaticly quits. I'm not given a change to install anything anywhere.

All my partitons are GEM partitions made by HDX.PRG

>These are always named AA, BB, CC etc so look like they are
>temporary files being created by something and then not being
>deleted afterwards.

Are you running a operating system that supports V-FAT (long filenames, if so these strange entrys are actually directory information representing long filenames, they are quite safe and should not be deleted or tampered with in any way or you may lose data. Ive got hundreds of these entrys, they are nothing to worry about and will be invisible under a Vfat syste,

There is an un-copy function in Atari Checkdisk.
Sometimes it works.
Total solution for text-files that are lost:
something calles 'Salvage'. Reads all sectors and makes a
textfile from a bunch of them.
Then you go sorting it out in an editor like QED...{:-(
I know because of a floppy-disk-change-not-detected condition this
week.

Dave,

>hello i am wondering if i can take the memory chip from my
>1040st and put it in my 1040ste for memory increase if not

No. STF(M) use DRAM memory soldered to the board.

>can someone give me advice on how i can upgrade my 1040 ste

You need 30pin SIMMS, standard "PC" ram, 120ns or better, though getting better will not improve your performance, I'm informed it will perform ok with 150 as well, but maybe someone could confirm this with you. Some also recommend 8 or 9 chip SIMMS, I use 4 chip RAM with no problems atall.

Regards,
Greg

Has anyone tried to put more than 128 Megs of Fast Ram into a CT2B?

Will more than 128 Megs work correctly in the CT2B?

Also anyone know the best type of Fast Ram Memory to use in the
CT2B other than from Centek?

Just copy AHDI.PRG to /auto on a floppy. Boot this floppy making sure that ahdi.prg runs. Then run Hinstall.prg. Hinstall.prg will not see any partitions until the driver ahdi.prg is loaded first.

My ImageCopy is v 4.01b2 CD: I have it running right now, while I'm using
NEWsie with EdHak as its editor, and Thing still present. So no problems
here. You may have something set up incorrectly: I can't think what.

But I do have exactly the same result as you did with the game 'Tryahoo'
by Stuart Denman which worked ok some weeks ago but now is playing up:
no settings have been changed since then, so why?

BTW has anyone Stuart Denman's address? My email for help has bounced.

>to reset the computer to get it going again.

I know... it's the only thing to do. Let's see if real tech help surfaces
here: it usually does :)

Charles.

Can anyone help, my Falcon has got belly up.
When it`s booted up I get my IDE drive, no SCSI but Falcon Processor
on SCSI ID 4. Have tried to boot up from floppy without IDE but still
the same. Have had to set up my Veloce to get back online. I can get
to some of the software on the F. hard drives with the veloce but

have some problems with others.
Does anyone know why the Falcon doesn`t want to know any SCSI
drive?
There`s some software that is only on the above hard drive, which
I`ve not got around to backing up yet. Ya a bit silly.
Thanks for any help. If...

Karl

Hmmm, looks like you just contradicted yourself you sick pervert!.. why don't you just go and cut your own throat before you do harm to anyone else. If you arn't into child porn why stipulate 14-16 and female?

whats wrong with LEGAL 18 year old models of both sexes?

Admit it, you just want to make the industry look glamourous to young
girls so you can get what you want. You people make me sick.

Just FUCK OFF AND DIE you SCUM!

You can't install a bootable driver on a floppy disk with HINSTALL.
What you can do is put AHDI.PRG in the AUTO folder of a floppy disk.

You can get the entire Atari HDX utility pacakge on an Atari
ftp site I'm sure. Uploading it to usenet would be a bad
idea. Please check ftp sites...

Do you have the SHDRIVER.SYS file, you could rename that to SHDRIVER.PRG
and put that in the auto folder of a floppy!.

        Regards from STEve & his nice warm cosey PAK'd MegaSTE.

Hi Andy

>hi. i just obtained a supra drive hard drive. i was wondering how i'd go
>about installing it and getting it to work on my mega st.

There's a good chance that as its an Atari type drive that plugging it in,
switching it on and then powering up the ST after a wait of 30 seconds that
it would boot straight away, that is unless the previous owner wiped it
before parting with it or that it is faulty.

If it does not boot and assuming its functional then you'd need some driver
software which initialy you'd run from floppy and then use its utility
program to 'install' it onto the hard drive. You'd then have to partition
the drive in some kind of scheme to suit your 'M.O.'.
Now install some software and get bsuy man!.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

Perhaps I am incorrect, so I will let others comment on this first. But I thought there was some trouble with early 20meg Supra drives and the Megas. Perhaps this was true with the 30?

Anyways, 1st I will assume you have the Asci cable.

You will probably need supras hard disk utilities, But I am not 100% certain on this either. Perhaps Atari ADHI program can boot the drive as well.

So, lets backtrack to some basics that are appropriate.

When you turn on your computer, you 1st turn on the HardDrive and give it time to boot. The drive may have a bootstrap installed on it already. If this is the case, you simply turn on your MegaST and wait. Hit the spacebar as this sometimes speeds up the megas response time. You may get a number of drive icons on the screen. If only A and B appear, the drive probably doesn't have a bootstrap installed. So, just to make certain. Highlight the Floppy DRive Icon and INSTALL a NEW Drive Icon Called "C".

Double click on "C" and check if anything appears. Like a Window. An error message is not optimum:-).

Look for a SUPRA Hard Disk utility on floppy. Their should be software on this disk that allows you to boot the HD. Again, install a drive letter C to be certain.

To boot from a floppy, turn on the HD, place floppy in Drive A and wait.

If you don't have supras hd utilities, you can try others. Although I would wait to see what others say with regard to HD DRIVER and Supras.

You can find Ataris Hard Disk Utilities at
http://www.umich.edu/~archive/atari

But if I recall correctly Supras where a different beast. Finally, I think that some of the utilities can still be found at Supras FTP site? I also recall someone finding stuff there about a year ago.

Hope this helps.

Later Brian.

You need the MSA packer program. MSA is a program that will read a
whole floppy disk to a file, and vice versa. You can find it at
ftp://ftp.lip6.fr/pub/atari/Archivers/msa_2_3+.prg.

Hi!

I got these files from the DHS site, just how do I run them?
They have the .MSA extension.

Regards,

Jim W. Krych

Yep, you're right. I found AHDI on an Atari ftp site and when I ran it
it worked right away. Thnx to all who responded!

I checked the supra ftp site the other night and it finally seems to
be down:). The HD drivers were in the modem files:). I emailed the Supra
package to "Andy" but didn't hear anything back from him.

(This is a repost request, Programmers didn't have time to answer I guess:)

How does one copy a patched ROM that resides in TT ram (Ala Afterburner Tool Kit) and save it to a file? I'm pretty ignorant when it comes to addresses and such, so please walk me through saving the ROM image, and what to tell the Electronics guy who is going to burn a new ROM for me what to do with it.

TIA,
Mike

That is a complete diskimage mostly used for auto-starting floppydisks (games).
The de-packer needs a floppydisk to reconstruct the original disk to the bit.

I have three 50Mhz 060's, one for my Falcon, one for my Milan (when available, and one is sort of extra. I paid $180.00 each. I have never tested them, and have no way to do so right now. They were purchased from an Amiga dealer.

Greetings,

Can anyone help me with the installation of a JRI Genlock in a Mega ST? I gather that I need to pull the video shifter ship, and seat it in the underside of the Genlock board, then fit the Genlock in the Mega video shifter socket. Then there is a black wire that is loose from the Genlock and I'm not sure where it should go. I tried running it to ground, but nothing happens.

Your assistance would be greatly appreciated.

This is about as much of a long shot as I can think of...

Several years ago I left the Atari World, when I sold my TT to a person in Canada. I recently have found a need for the source for the CD-Rom driver I wrote for it. I have the Mint executable, but I want to get a hold of the actual source, which was on the hard drive.

Since I no longer have the name of the person I sold the system to I am posting this in the faint hope that that person still has the computer, and more importantly still has the source code.

I had also shared the source with a person in Europe, but I do not have that name either.

So if anyone in Canada bought a TT from a person in Raleigh NC could you help me out?

Brian

Correct. You can get the emulator for free from Motorola (look for fpsp060 package).

I made a modified version of the ISP060 part (only the integer emulation) which is now in the Milan TOS for the 060 (the TOS comes up fine without the emulator on a 060, but I had a hddriver at that time that used movep).

Performance is not too bad: with the old HDDRIVER version which uses movep in the IDE disk transfer loop, I was able to get about 600K/s disk throughput with my version of the emulator (the normal HDDriver does *not* use movep anymore, so I could now remove the emulator again - however, leaving it in saves one auto folder program).

>What I would like to have is just enough code to get the machine to
>the auto folder. I don't really care about the AES or GEM on ROM, just
>get it to the auto folder for MiNT and NAES. I know this means always

All movep in the TOS are in assembler code in (X)bios. Gemdos, VDOI and AES should have no movep in them - so you have a bit of work to do and patch all those parts of TOS that use movep.

Help! I'm trying to get an AB040 installed in my Falcon MK-X, and it's not working. The installer say he has done dozens of Nemesis and AB040 installations into regular (stock Atari) Falcons, but not into an MK-X. If there's anybody out there who has done so successfully, *please* write me at msh (at) qadas (dot) com ASAP! Thanks very much in advance.

Yep, it won't work without these things.
You really need NVDI 5, HSMOD, Olga, AV server (Thing or Jinnee desktop)
and a multitasking system. Cab is handy but not necessary.

Because Olympia make use of a special MagiC (only) file call protocol
you'll get 'ILLEGAL AES calls' warnings whenever you start Olympia under
N_AES. However you can overcome this by using a file selector which
supports that protocol. The only FS I know which can handle this is
'Boxkite 2.13'

Both Olympia (demo version) and Boxkite are on the Belgian ftp-site

I have seen movep being used in a old AES/VDI lib, cant remember which one
MEGAMAX or GEMFAST or SOZOBON? But there are sure old GEM programs around that
use movep.

Hi!

I installed a CT2 in my F030 and the old 4mb memoryboard was too slow. So I
replaced the old 80ns memorychips with some 60ns chips i found on a 8 meg
simm. Its a bit tricky to doo, but it is very cheap, and works great as long

as you don�t need more ST-ram.

And for the question: I noticed that the IDE bus on the F030 is _VERY_ sensitive, you cannot use a cable longer than 20cm. Is it possible to add some kind of driver circuitry to the bus? like 74LS245? Would it be possible to use a longer cable with this mod?

That does not matter, since you can put the FPSP060 emulator in the auto folder.

The matter is if the TOS uses movep internally, which leads to a crash before you can execute anything to load the emulator, and I am quite sure that the compiler which atari used for the TOS did not generate movep - those are only found in assembler code.

I spent the afternoon looking through the Atari Compendium, and didn't
see one instance of "movep" being referenced. It looks like it does
only come from assembly. I took a peak at the latest release of the
040/060 MiNT kernel, and it is present there as well.
I began writing (more like copying) my own boot strap and have been
test loading it from floppy on the 040. So far so good, and maybe will
have a ROM for the cartridge port next week. I removed the movep from
the beginning of TOS, and the 040 doesn't know the difference:).

Here`s 2 for you to have a look at. Both have ample and up to date stuff on them. Both sysops are very helpful and chase up something you might be searching for,including newsgroups.

The Andromeda Galaxy - John Cheyne - 0148 9690786

This one includes another BBS that closed a couple of years ago and the sysop will change CDs for you to widen the scope of the BBS.

The DRUID - Peter Carr - 01745 571740

Another well endowed BBS and right up to date.

Hope this helps.

Regards Derek

The Spectrum Atari Group of Erie is celebrating FIFTEEN YEARS of dedication to Atari enthusiasts with a unique multi-media CD, entitled "A Fresh Perspective". THIS IS NOT JUST ANOTHER SOFTWARE COLLECTION!

Everyone who appreciates the days of fun and friendship in their own user group will want to get this disc. Whether your interests were 8-bit, ST/TT, Jaguar or Lynx this CD has you covered. It has something for everyone!

It's filled (over 640 megs!) with Atari-related text files, pictures, videos, songs, sample web-pages and an HTML tour that helps you get familiar with the disc's contents. Order it today!

Log onto the SAGE website at http://www.erie.net/~sagedm or at sage.atari.org (if it's working!).

I like to go starting with an atari and a midi keyboard. I have to start
from scratch. I'm the owner of a 1040 stfm. My question is: what for
keyboard do i have to buy. I'm looking for an good price/quality.
Second question, what is important to look for when buying a midi keyboard.

Greetings
a.v.d.moosdijk@hccnet.nl

Hi folks,
I think I have a virus on my ST which attacks my floppy !! Does anybody
know something about that and which v-killer i need ?? After the attack
two of mine ST's can't format disks anymore and sometimes bomb out, when

i try to boot from disks, which yesterday worked fine. In the directory
are strange folders and files which couldn't be there!! I'm totally
frustrated and near to commit suicide. I need HELP .
Does anybody know how to reconfigure a floppy head (SF314 and in my
1040STF

```
??
Cheers,
Tobias

Hi,

I'm trying to load some sys.ex files that I have stored on my PC into my
Atari - any ideas on how to do this? Floopys don't seem to work.

Cheers

Andy

I am installing my Centurbo Ii on my Falcon :)

I have a question:
1. The printed manual states to cut pin 17 of the CPU, bend it,
then solder a wire to the pin and solder the other end of the
wire to the pin 10 of u59.
Now, Rodolphe added a hand written "update" to the manual
stating that the "...68030 must be removed of the Falcon
motherboard." If I remove it what do I do with pin 10 of u59?
Anything?
I have Emailed Rodolphe about this. I just thought some of you
may be able to help as I am sure Rodolphe is very busy.

Thanks,
Bytor- USA

You should be able to use a floppy.
I am assuming you have a double sided (DS) disk drive on your
ST. If you have a single sided (SS) it is still possible, but a
little more tricky. The 1040ST and Mega ST came with a DS as did
the SF314. The SF354 and some early 520STFM had only a SS drives.

1. Buy some Double Sided/Double Density disks (DS/DD) not HD!!
You can still get them from Radio Shack and even Walmart here in
the USA.
2. Format the a floppy on your PC at 720kb (not 1.44mb).
3. Save your sysex info from your PC on the floppy.
4. Your ST should now be able to read the disk info.

Hmm, this is a bit like asking "What car should I buy?". My
Yamaha PSR300 (nearly 10 years old) has touch sensitive, full
size keys. These were my only two requirements then as well as
now (besides MIDI, of course). However, I'm a lousy pianist,
and I only use my keyboard for assistance with my vocal
rehearsals. Perhaps you should tell us what you intend to do
with the keyboard once you have it.

Galen

I have a 520 ST with out ROMS. This is a early version of the ST when
TOS had to be loaded from disk. Problem is I dont think the ROMS are in
the correct sockets. I dont get the fance screen that comes up when tos
needs to be loaded. Does anyone know where the 2 roms go? Any
information would be appreciated.

Thanks Don

Lovely bit o' kit! :-)

>Now, Rodolphe added a hand written "update" to the manual
>stating that the "...68030 must be removed of the Falcon
>motherboard." If I remove it what do I do with pin 10 of u59?

I'd try lifting that pin and connecting it to the wire as originally specified in the manual and trying the Falcon out before going down the road of removing the CPU altogether! That's how I installed mine.

Otherwise, I believe that you can leave that wire unconnected.

Rgds, Derryck

Yes, that modification connects pin 17 of the CPU to GND.
(Let the CPU sleep)

> Now, Rodolphe added a hand written "update" to the manual
> stating that the "...68030 must be removed of the Falcon
> motherboard." If I remove it what do I do with pin 10 of u59?
> Anything?

Yes, that means you have to remove the hole SMT CPU from mainboard.
(Most of CENTEK fitted F030 had not longer the orignal CPU)
(CPU isn�t at all only with pin 17 to GND)
(Maybee not all falcons work well with only bend pin 17)

URGENT: Leave it if you are not firm with SMT!!

> I have Emailed Rodolphe about this. I just thought some of you
> may be able to help as I am sure Rodolphe is very busy.

That means: Send mainboard to CENTEK. They fit your CT2 in one day.
(Without shipping)

Regards, Robert

I've got lots of monochrome PD/shareware, but not on the web.

Drop in at www.last-pd.co.uk and download the disk lists in MSA and
Fastcopy Pro format.

If you would like the disk in another format, and enough people want it
I will add it:)

Rodolphe Emailed me back and stated to remove the whole CPU. Of
course, this will mean to forget about the jumper to u59.

Other questions to add:

What are some suggestions on memory configurations with the CT2?
I now have the Atari 4mb STram onboard. I believe that it will
not work (?). I have heard that it is to slow.

Now, for the fast Ram: How much is enough for most applications?
128mb seems a bite excessive to me, but I am not sure?

Also, where will I notice the biggest advantages if I add an FPU?

Thanks all,
Marvin A.K.A. "Bytor" USA

I changed STram to 16mb Wizztronics board but as most things will run in Fastram the amount of STram is not that important. It needs only be enough (and fast enough) to display the screen buffer.

> Now, for the fast Ram: How much is enough for most applications?
> 128mb seems a bite excessive to me, but I am not sure?

I have 32mb installed and feel very much on the safe side.

> Also, where will I notice the biggest advantages if I add an FPU?

If you're interested in raytracing (e.g. POV) or audio manipulation (e.g. denoiser) the FPU is surely worth the money.

The standard 4meg memorycard from atari uses 80ns memorychips - too slow. However if you replace them with 60ns memorychips it will be fast enough. (I replaced mine with some chips from an 8 meg simm. It has to be one with 16 chips on it - 8+8)

/Peter

All Fortress BBS users.

Now theres something ive been wanting to say for some while!. 8~)
To business

Following some TLC this evening the <Fortress> BBS is now up and running again.

Problems were down to the ICD clock not rolling over correctly at new Year resulting in Jetmail being a tad confused.

The Clock has been reset and re-boot tested, Jetmail has been upgraded.

Note, this system is Mailer only at the moment.
The sysop is not in residence so dont expect quick answers to any mail.

If there's a problem you can NetMail myself and i'l pass on anything i deem relevant. 8~)

Would all international NeST nodes please attempt a poll to catch up.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

Hello,
Does anyone on here use an Emulator for the STe. ATM, I am trying 'Gemulator' but for some reason it doesn't seem to get past the set-up procedure. When I have told the APP where the files are located for MagiC v5 RAM file and installed the GEMDESK/GEMSYS folder et al, the HD busy light stays on intermitently (as if it's trying to write something to the drive but can't). Any idea what I need to do to be able to set it up correctly.
I am using a P75 trying to run MagiC v.5.

Follow the advice that you've already been given. Don't remove the CPU unless
you really have to!

>What are some suggestions on memory configurations with the CT2?
>I now have the Atari 4mb STram onboard. I believe that it will
>not work (?). I have heard that it is to slow.

Again, try it first. If you get (in colour modes) some flashing pixels, then
the memory is too slow.

>Now, for the fast Ram: How much is enough for most applications?
>128mb seems a bite excessive to me, but I am not sure?

Up to you, 32Mb is plenty but more never hurts, if your wallet is deep enough.
You need a low profile SIMM, otherwise you won't be able to close the case up
without using spacers under the screw pillars and under the keyboard.

Rgds, Derryck

What did you expect?

movep is an assembly instruction, so you will only find it referenced in assembly programming documentation.

After all, you won't find documentation on 'lea' or 'move' in a book like the compendium either, although you can expect a C compiler to generate these.

It could be the card is trying to use the same IRQ settings in your PC
as another card (Sound, video, etc).

Hi all!

I'm having a problem with v1.22 of Sting, in that the DNS cache load keeps failing (the message keeps coming up on loading in the Auto folder).

With previous versions all I had to do to get rid of this message was to delete the CACHE.DNS file, but with this version the message still happens.

I'm using a standard Falcon, 14Mb of ST Ram, MagiC v6.01, NVDI v5.02.

Anyone?

Cheers!

James

Hi all!

Does anyone know if this can be done on an Atari? It's not for copying of copyright material, as I'm doing a website for a friend who is a musician, and it would be very useful for him to have a track or tracks converted from his CD to an MPEG, which could be downloaded from his website.

If thats's not possible can it be converted instead to a WAV file (without resampling)?

Cheers!

James

I seem to recall many moons ago having this prob, if ignored it will recover. Is it a fatal eror or are you able to continue.?.

Yeah, with previous versions of Sting you could delete the cache and it would create another file, but not with this version for some strange reason.

It's not fatal, and I can still connect and surf etc, but it's a little worrying seeing it come up every time I boot!

Cheers!

James

Any idea if it will be going back to full BBS mode soon? It's not worth me sorting out my point system again, as I only go on it once in a while now, and only to see if there are any files I want or to see if there is any life in NeST etc! :)

Cheers!

I am supposed to know the basic things because I am IT professional. If I
try to copy the file from a:, got the massage" A: is not accessable" and
there is the end of story.

You are partially right here. When I use Gemulator, I can see the files and
file names. When I click property I can see how big file is. When I click
copy (edit/copy as a text) it really copies but could not paste text
anywhere. It seems I need SIGNUM (a very old text processor for Atari) for
my PC to run the text or I need Atari computer where I can use SIGNUM from
diskette.

Hello!

I'm in the process of disassembling my Stacy to install a bigger
hard-disk, but ran into one stumbling block: the display's wire
harness. It is too short to easily move the top assemby appart,
or even to access the connectors. What's the trick?

Maybe I need to give you better explanation. When I click copy (edit/copy as a text) it start to produce noises like it copies, but when I try to paste it in Word processor the result always looks like this:"sdoc0001" with no matter what file I use to copy and how big it is. It is not even the file name. I do not know what is this.

You'll have to dismantle the screen and unplug the wires in that end
before you attempt to open the rest of the box.

open the screen back and loosen the cable strain clip there, this will gain you another inch, many people have killed STacys trying to upgrade them, I managed to put a large hard drive and HD floppy controller in mine, one tip the internal SCSI host only supports up to Gig and is fussy as to what drive it has, good luck

My Atari is getting long in the tooth. I suspect it may die any
day. Also, I did a lot with Laser C before my Atari hard drive
crashed and rather than buy another Atari hard drive- it seems
sensible to do it all on a PC in emulator mode- until I can
learn MS Visual C++, then convert the programs written on the
Atari for my consulting business. The author of Gemulator swears
it works. Whenever I write him a message telling him it doesn't,
he bitches that I dare complain while telling me- insisting that
it works. What an asshole. I hope he's reading this. <G>

Thanks, I'll give that a try. At least your message was an effort to help
unlike any of the dumb ass messages I got from the author of Gemulator-
sarcastic messsages about how great his program is, with no help.

It's also practically possible though with a lot of TTs you get transfer
errors when fast devices are connected to the ACSI bus. (You also get
this regardless of whether or not you also use the SCSI bus.) Generally
it's a disadvantage to use the ACSI port when SCSI is svailable.

If its for a PC Atari emulator there is one with it in the ZIP file, if you don't have one go to LETS FORUM BBS or THE DRUID BBS and download one off either of them. I'm not sure of name, but one of them doe's have a prog for doing what you want.

Try talking to Rob Follett at the LETS FORUM BBS I seem to remember him saying he had this problem and he used the PS off an old PC 286 for his.

I guess you are using the free Gemulator 2000? If so I would not expect any real support at all! And it is well known that Derek is not really very polite :-) But his program is actually very good and free, so I suppose he has the right to behave as he likes. And it's very likely that your compiler is doing something illegal not (yet?) "covered" by the emulator.

Actually I too had problems with Gemulator-98 freezing my pc so I had to press the reset button. I did upgrade to the latest Directx drivers 7.0a (?) and the new Gemulator-2000 and since then it works OK.

Also the latest STinG (Atari tcp/ip kernel) no longer runs with Gemulator. I think it's about the handling of serial in/out-put buffers not behaving like on genuine Atari hardware.

The same goes for other [hardware] emulators like the Milan (aimed at those who dislike discussions about emulators in the group!). Most old programs works but some don't.

I bought, two years ago, a NOVA VME card for Atari TT. It works fine, but I have
no technical documentation whith it and I think it can do a lot.
Where may I found technical informations (I think it is a MACH model).
Who made it?

Thank's for reply.

             A. Emond

I suggest looking up Homa Systems' web site.

Want some disk images for your ST emulator? Perhaps there's a specific game you want to play, but the ravages of time have knackered the disk you've got. Well, worry no more! One CD containing the entire Automation, Pompey Pirates, Flame of Finland and DBug archives, approx 6000 games!!!!!

Also includes PaCifiST v0.49 beta, WinSTon 0.2r2 emulators, along with the relevant tools to dump these images onto floppy disks for use on a real ST!

How much?

5 UKP inc p&p (within the UK) - will send internationally, please email me to discuss postage.

Email justin@hellraiser.demon.co.uk if interested!

ComputerInsel produced that card, they were located in South Germany.
And right, there's a Mach32/64 ATI board inside the black box.

Sorry that I can't help you more, but I got a TKR Crazy Dots HC (ET4000
based, completely fitting into the TT case).

I written a hardware accelerated fVDI device driver for the Eclipse/RageII,
so I'd say I know a thing or two about the mach64 engine.  ;-)

The developer docs aren't public information, AFAIK, but I could
certainly answer some questions. Since the Linux mach-drivers are
available, I believe I'll be able to release the Eclipse/RageII device
driver code under the GNU GPL too, but I'm not 100% sure about that.

I think those are still supported by Homa Systems House. You can
probably find the email or URL by checking some of the FAQ sites like
Halvaard's Atari Hyperlink Launchpad, or running a net search.

Hello

Not Mega troubles with the MegaSTe keyboard, just some trouble with Space Bar. It is sticking down on the left hand side near the Alternate key. I have taken apart ST, STe, and MegaST keyboards, but these look alittle different. Does the Spacebar pry open like the previous boards? It doesn't seem so, and it also seems more fragile. So I don't want to break the keyboard, just to look to see if a spring has come off. Any information on taking off the spacebar key would be appreciated. On the STs, this was actually a tricky key to take off and then put back on.

Thanks In advance
Brian.

Richard,

I have had the same problem with my own STE.  It is a problem with superboot
as the setup program only allows a year with a '19' prefix (you can only
change the last 2 digits).  But apart from that, if I set the date using
Xcontrol after booting there is no problem.

Is there a newer version of Superboot available or a patch that can correct
this?

Steve O.

You can't buy Computerinsel's Mach64 graphics card for the TT anymore.
The last batch was manufactured about three years ago. Homa no longer
has any stock (except for the Falcon model).

The specs are available here:

http://www.magma.ca/%7Enima/html/nova/nova.htm

So have you fixed it dude!
I bet my MegaSTE would look nice in a MK X case, does anyone know if it
will fit, or alternativley what cases would take my MegaSTE.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

If I am correct both Turtle and Superboot where shareware from the same
author. Superboot hasn't seen an update in years. I still use it in my ST.
Xboot for everything else, which has a similar problem.

I suggest you go to John Whalleys Y2K page on the ST.
Also the Belgian FTP site has the Y2K patches. But these are not specific
to Superboot but merely fix the Y2K problem.

Brian.

hi
I have just got a Quantum Fireball TM.
Now I know of problems wuth these drives, such as one cannot boot
from it if you don't have Link97, but I boot from my Falcons IDE
drive so that is not a problem.
However,
even after setting HDDriver to use SCSI initiator for id 7, and
setting up the drive according to quantum specs (from www.quantum.com)
HDDriver does not see it!

ICD does see it though! I have the ICD Pro Utils, and if I boot with
ICD it sees the Fireball. I booted ICD, then went into HDdriver and
partitioned the drive, etc
BUT HDDriver still doen't see the Fireball when i reboot.

At present I boot with HDDriver, and have ICDboot in the auto folder.
For some reason I cannot install ICD as the booter, so this is the
way I have to do it.

It works except with Magic. but even so it is not a good solution.
Can anyone suggest a solution?
thanks.merci

ken
the TAF guy

HDDriver 7.71
Quantum Fireball TM, SCSI id 1, no termination.

Hiya

I have a collection of PC's and ST's... I would like to be able to get my ST's to connect to my Network of PC's thus enabling them to access the net via the network.

What hardware would I require for this? I can vaugly rember a cartridge that provided a BNC network connection.. is there anything similar still around or perhaps instructions on how to build such a device?

Idealy I'd like a UTP solution but a BNC solution would also be acceptible. Thanx in advance.

Graeme

Hi All,

I have suddenly been finding 'strange' files appearing on my hd ! These are always named AA, BB, CC etc so look like they are temporary files being created by something and then not being deleted afterwards.

These files do not appear on the normal TOS desktop but show up under the UIS fileselector as ticked and greyed out - I assume that this means they are hidden - but show no size.
Trying to load one with, for example, Everest gets an empty window (as Everest thinks there is nothing in the file).
Trying to load with some other programmes results in a message that the application could not find what I tried to load....

On the other hand, using CAB (online) to 'Load Local' shows the file to have a negative filesize !!

I had been wondering if the problem was being caused by the DSP port clock cart (Clarity) that I have just added to my system, but further testing has led me to a different conclusion.

If I try running CAB without STiNG loaded, then the file appears as under UIS.

Having just installed the latest version of Olivier's OVL, I must suggest that this is what is causing the problem.

Anyone else come uop against this yet ?

Cheers,

Jim

Hi!

In article <388b1398$0$154@news.zetnet.co.uk>,
     jimsmith@zetnet.co.uk (James Smith) writes:
> I have suddenly been finding 'strange' files appearing on my hd !
> These are always named AA, BB, CC etc so look like they are
> temporary files being created by something and then not being
> deleted afterwards.

These are pseudo entries created by VFAT. They contain the long filename
information and aren't visible under plain DOS. Unfortunately, TOS -
depending on the GEMDOS version and the search attributes passed to
the Fsfirst() system call - does "see" them.

These pseudo entries aren't harmful, they just mess up display of
directories, cause wrong byte totals to be computed or some other weird
effects. If you reformat - like "res" (one of those "I quote everything
and write one line above it"-posters :( ) suggested - you'll of course
lose all your data on your harddisk - not a very clever idea, IMO.

Instead, just get and install HideVFAT
(http://homepages.tu-darmstadt.de/~gryf/software/hvfat_r1.lzh), it will
solve your problems without losing data. Be sure to read the
documentation!

Ciao

Thomas

Hi,

I am asking this for a friend, (bloody hell, sounds like I'm at the doctors about a supicious rash ;-)), anyway is it possible to take the TOS 1.6 chips from a Ste and put them in an STFM 1040 to upgrade the TOS?

Regards,
Greg

These are long filenames that normally aren't seen by TOS.
UIS shows these files. I also found that UIS can delete these files.

>On the other hand, using CAB (online) to 'Load Local' shows the
>file to have a negative filesize !!

Just ignore trying to load these files. They aren't really files.

>I had been wondering if the problem was being caused by the DSP

>reformat

I don't know why you would recommend this? Before telling someone to reformat, you might state why to do so. If you stated why he should reformat, I might learn something. As of right now I believe he doesn't have a serious problem but only now is seeing the extended files. I don't think reformatting would help?

But I could be wrong.

I have an old 1040ST that I just took out again the other day. I was copying files from Atari-formatted ones to PC format, so that I could back them up on my PC. I was using Hypercopy to do this; it had problems with the last file on one disk, told me that I had errors on the disk, and did I want it to fix them. In a moment of pure stupidity I replied "Yes". Goodbye all data on the disk. I don't know exactly WHAT it did, except that the diskette now shows up as 360K and 0 files. Does anyone know of ANY program (hopefully freeware or shareware) that might get the data back?

Thanks,

Dave

Thanks to those with the sensible answers !

To Brian;
UIS does not actually delete the files. It appears to, but they
are still there !
I can actually tell you when these things started appearing due to
the way I work with my drives
i.e. Newsie folders are installed on a separate partition (due to
some problems with Neswie in the past) and this partition is
tidied up on a daily basis.
Although I use Edge, I always copy the folders to a different
partition, delete the originals, optimise to delete removed
directory entries, and then put the Newsie stuff back.
As folders containing these strange files are not able to be
deleted by the desktop, this is how I found out they were there.
On my Newsie partition, I have a folder called XFILES which I use
as a work folder for downloads from CAB sessions - this was where
these files appeared.
And this is why I suspected Olivier's OVL......but, read on ;-)

I have been doing some testing with stuff in my Auto folder on
drive C recently and have been backing it up with Diamond Back
prior to making any changes.
Today I have found a couple of these files in the Auto folder !
As I have backups for several days of work, I can tell you that
they are not in the backups prior to Jan 23rd, but have appeared
again today.
I am now suspicious about a couple of other things that might be
behind it and am going through a process of elimination to try and
find out for sure !
For that reason, I will go and get the HideFat as suggested by
Thomas, but will avoid using it until I satisfy my curiousity
about what is happening ;-)

All this does lead on to another question:- I have been going
through some PC CDs over the last few days to check out the
animations, sounds and gfx files. If there is a virus on one of
these, could it be responsible ? I was under the impression that
virus programmes were not cross-platform, so it is just a thought
that I want to check out.....

Many Thanks for the replies.

ATB

Jim

I was looking into the same and tried the gemxplor.zip file. The program contained in it can read some of my disks. I was also told that Windows can read some of the ST disks without any helper programs. Those are probably TOS 2.06 made disks. I don't have that TOS version here, so I cannot confirm. I have only Mega ST4 and 1040ST US TOS versions here.

You can probably find the file in any search engine, my favorite is www.google.com. It looks a lot like the file browsing program "NT Explorer". You can also drag and drop the files. It does write to Atari formatted disks if you drag and drop files on this program.

I didn't keep track of where I found that program, but it is freeware.

I don't know what format your files are for your word processor or how to convert them for use in a pc program, but to transfer files as is from my pc to ST and vise versa i just use my LS120 drive on my pc to format DD disks to 720k and they are readable by my 1040STF, but my drive can't read a disk formatted by the ST. When i download st programs off the net this is how i use them right away. Most modern 3.5 floppy drives can only format in HD (1.44) but if your drive is capable of DD formats you should see the option when you try to format a floppy (720k or 1.44mb). If not it will only let you select 1.44 mb formating. Just remember format on PC, use on both.

Hey, if you have received no responses or help by now, let me know,
and maybe I can dupe off some disks and get them to you.

Doctor Clu
Though mostly 8-bit these days, still fascinated by Spectre.

^ :-/ That�s nonsense,
Allow me to translate.  The controller can address 8 IDs (0-7).  One
is probably your boot drive, and another is often the computer itself
(or the computer's clock).  This allows for up to 6 additional items.
Cabling becomes a problem, however.  Although the SCSI interface is
good for 5 meters in theory, high quality short cables are a must.  I
have a 1Gb HD that gave many errors when it was the 4th item in the
chain yet runs reliably as the 1st item.  This is not supposed to
happen!  Yet it does.

Not really. In fact, you can have an ACSI->SCSI adapter (like the
Link) and have two completely independent SCSI buses! I'm not sure why
you'd want to do that, but you could.

Check out http://www.whalley.demon.co.uk/atari/texts/wp_help.html - this
includes information on disk access etc, including links to the site
where you can get Gemulator Explorer (reads ST disks under Windows), and
links to utilities for file conversion including a WordPlus to RTF
converter which has TOS, DOS and Mac executables in the same archive.

There is no size limitation regarding the drive as long as you have an ICD compatible host adapter, e. g. a host adapter by ICD or a LINK96/97. Note, however, that TOS 1.06 doesn't support partitions larger than 512 MByte. This limit can be lifted by using MiNT or MagiC with other filesystems like FAT32 or ext2fs.

Hi,

What sort of problem?

1) The MIDI files are incorrect if you play them after transfer?
2) Or you just can't copy them?

Actually I use an Atari for all my initial MIDI work, because the Synch is better on the Atari, than with Cubase VST on the PC, then I transfer them over for mixing down. But I always format my floppy disks on my PC before use, and that seems ok. If you still have problems, try and get 720 floppy disks, you can format HD floppy disks as 720, but they can be very unreliable.

If is the playing part, then let me know which two packages you are using
Atari Side and PC Side.

Regards,
Greg

I think it also has to do with the SCSI host adaptor you are using. I tried a 1GB in an ICD FAST (circa 1987), and when I wrote ICD for help, they said that adaptor didn't support modern drives, and to update to a Link 2 host. If you stay in the 200-400 MB range, you should be safe if you have an outdated host.

I have been running a 1 gig drive in my FA*ST box for about six months
now - no problems. (TT030 with 4+16, Magic 5 later 6, and TOS 3.06)

THE "NOTATOR" PROGRAM ON THE H.D. SEEMED TO NOT WORK
PROPERLY.
AFTER SOME INCAUTIOUS OPERATIONS, ATTEMPTING TO RE-COPY
THE "NOTATOR" ORIGINAL FLOPPY ON THE H.D., MY ATARI DOES
NOT SEE ANY MORE THE H.D.
I DON'T HAVE ANY MANUAL, NOR THE H.D.'S NEITHER THE ATARI'S.
I DON'T HAVE ANY TUTORIAL DISK OR DRIVER FOR THE H.D.
I JUST HAVE THE ORIGINAL "NOTATOR" PROGRAM (WITH HIS KEY).
OBVIOUSLY, I DON'T WANT TO START THE "NOTATOR" ALWAYS FROM

THE FLOPPY, BECAUSE IT TAKES MORE TIME AND I WOULD RISK TO
DAMAGE MY ONLY ORIGINAL COPY.
WHAT SHOULD I DO?
THANK YOU. PIRAC2

John,

Thanks for that. I will probably nick one out of a machine from work and see which is compatible. Though I have actually seen some real bargains for SCSI drives, 500mb �40 etc. So I will probably snap one up soon.

My current drive is a NEC in a Power Drive Slimline box by Power Computing. And it just plugs straight in to the Atari, unfortunately it doesn't have any option to chain other drives.

Regards,
Greg

I think that 1.44M diskettes are only recognised by TOS 2.06, and were
fitted on the later Mega machines, but maybe I am wrong. But as it stands no
it won't.

> Also, can anyone tell me whether the 520STFM with PAL Television output

Plug it in and see <s>, though if its PAL I can't see why not.

Hi,

I want to buy a book for reference/teaching Assembler for my Atari, I am using DevPac. Anyone with some advice here and an ISBN if possible , also anywhere that maybe selling them specifically for the Atari ST and its hardware, new or second hand.

Thanks for any advice,
Greg

Hello,

I have problems with pure C and my Falcon. I can't debug programs (when I leave the debugger, the Falcon crashes) and it makes illegal errors when I leave the compiled program, do you know where I can find a patch for the falcon or where I can find an other C compiler.

Thanks

The internal SCSI adapter in the TT works fine with even the latest SCSI drives - you may have to patch TOS to boot from some drives which require an Initiator ID, but that is all.

External ACSI adapters are a lot more tricky, but on a TT, why would you want to use one? The internal SCSI controller is more stable and faster.

Try starting the debugger with Shift-Alt-D instead of Alt-D.

You need to load the files into 1st Word and save them as ASCII.
Alternatively you can load them into Marcel and save them as RTF.

In both cases you need either an ST or a ST emulator for WinNT. I would
suggest Gemulator.

Hi

Well for a beginner there are more than one book, depending on how deep you want to go:)

The major problem is that when you deal in machine code you need to know and have reference to BIOS, XBIOS & GEM calls (the TRAP #, commands). Abacus does a series of books, one of which covers machine code; I can't remember it's title off-hand.

Abacus does do a book called Atari ST internals, and this contains some useful info. It covers briefly a little of each area of the ST including a memory map and a partial listing of TOS 1.0! This still doesn't give you the FULL 'TRAP' command list!

Computes! Technical Reference manuals vol's 1, 2 & 3, are ideal for a good ref manual for programing VDI, AES & TOS. Volume 3 (TOS) does cover some basic principles for assembler AND C, with examples on each of the commands/calls. Although there quite a few mistakes, which adds to your learning:) I bought the set when I first saw them and it was the best �75 GBP I'd ever spent on books!

I'm also on the lookout for Atari books I don't have in my collection;
yep! I'm in a hoarding mood for books:) and am after collecting the
entire Abacus collection. I have book numbers: 2, 3, 7, 8, 10, 11, 12 &
13.

```

It is *not* Atari specific, but a good book on 68000 assembly language is:

68000 Assembly Language Programming, by Gerry Kane, Doug Hawkins, and
Lance Leventhal, Osborne/McGraw-Hill, Berkeley, California, 1981,
ISBN: 0-07-931062-1

You should try and get the first edition. The second edition is watered down
somewhat.

I have an external scsi 270meg syquest removable hd attached to my Falcon.
My Falcon has an IDE drive only.
The Syquest is identified as SCSI unit 0

I moved the drive over to the TT. The TT has an Internal SCSI drive.

I changed the unit # of the Syquest to #1 with a little dial indicator near the power connector.

I boot the TT with HD Driver 5.1, and only the Internal SCSI is identified.

The device testors also only show the SCSI internal as unit 0.

Of course the Syquest is fine on the Falcon when set to 0.

So I think I have done things properly by changing the id, what else might
I need to do to get the Syquest to work with the TT and its internal drive?

Final note, the desktop doesn't acknowledge the drive either with the
install devices pull down menu.

Thanks in advance.

Brian.

As far as I can go really, I have quite a wealth of experiance with
Assembler on 80x86/Z80, mostly for comms applications, and would like to
link the two physically and mentally, also it would be fun to do.

> The major problem is that when you deal in machine code you need to know
> and have reference to BIOS, XBIOS & GEM calls (the TRAP #, commands)...

Point noted. I will look out for this.

Hiya

"Compute!'s" is/was the publisher.

The ISBN numbers are as follows:

Vol. 1 VDI, 0-87455-093-9
Vol. 2 AES, 0-87455-114-5
```

Vol. 3 TOS, 0-87455-149-8

I do know. Books are info, and I give info freely and use them to help
other Atari users out. The more resources I have the more I can help,
that's why I decided to collect Atari related books that I don't have.

The bigger my book library the more knowledge/help I can give away. I
have 4 books covering virtually the same generic subjects, ALL but ONE
book has the wrong value for a specific area! including Atari's own
ST/TT development kit programming guide!

Oh yes! before I forget. If anyone has problems with my email address:
steve@atari.org please try one of the following:)

Mmm, I think I was only jesting with you by the way, it was a poor joke.
Anyway thats a nice outlook you have.

I am myself, at the moment have been busily typing out tonnes of stuff from my Spectrum/ZX81/Commodore/80x86 assembler development books to put on a web page as a free programmers resource for 8/16bit micros.

I don't want to start a revival of 8/16bit micros as such. But I feel that looking at the development techniques that were employed to make the best of these machines is very informative and educational to developers, especially those whom wish to make the best of computer development in the future.

Maybe you could spare some time once the page is up to contribute a little of your knowledge?

Possibly, I wouldn't know. But the TT came with an External CD Reader,
and it works. So I would think the external port functions.

Now getting that to work on my Falcon will be my new thread:-).

No argument, but I had the box, and I use the 1 gig (partitioned into
5) for backups - I figure it's a safer vault if it's a box I don't
have to turn on with the machine every time.  So I only turn it on for
making backups, and any time I need to access the archive.  The rest
of the time, it sits quietly under its dust cover.

If you have HD Driver set to only check for specific ID's it will not
see it. Run the HD Driver setup and make sure it can see it there.
I use a SyQuest 105R on my TT for years no problems, even worked
with the old Atari driver. I have switched to HD Driver though and it's
still working great.

Its tucked up very warm in my megaSTE, although its sister, another 4.5Gig
is in an external tower with my other SCSI equipment. Nice and cosy.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

I guess that you've set HDDriver to scan that SCSI drive's ID with its
config program?

Apart from ROS 2.06 or later you also need a small hardware mod to use
HD diskettes, which doubles the clock speed to the controller. Not all
controller chips are usable, but mopst are.

>> Also, can anyone tell me whether the 520STFM with PAL Television output

>Plug it in and see <s>, though if its PAL I can't see why not.

From memory, the Brazilian PAL-M uses the same colour subcarrier
frequency as NTSC (3.8... MHz instead of the European 4.3... MHz) so it
may well not work. But it is quite possible that the Brazilian TV sets
are dual standard, to receive foreign and satellite transmissions - the
same as most modern European PAL sets can also display NTSC quite well.

Pirac,

It sounds like (and very loudly <s>, try not typing in all caps, makes it a
bit hard to read), that you may have inadvertently deleted the hard disk
driver from the root directory. Do you remember if you were using hddriver,
or similar to mount the drive? It would have something like hddriver.sys in
the root directory of the drive if that rings any bells. If you have done
this, then you will need the installation disk to reconfigure the drive.

I would also consider gettting something like Diamond Backup to save you any
heart ache in the future.

Regards,
Greg

Further to this message, I tried to use the television output from a

UK STFM on an Australian TV.

The picture came up OK, but the sound channel was displaced from the picture signal by a different distance or direction than in the UK, and all that came through the loudspeaker was NOISE. It would be possible to take a further connection from the monitor socket to an additional speaker to overcome this drawback, of course.

Brain,

I use A Syquest 135Mg & a JAZ 2.5 Gig removable platers on a TT30 with no problems. Under HDriver Utility set the removable sector size and save the Driver, watch your boot screen to see if HDriver is booting the SyQuest, also make sure you have a termination bar on the out Port of The Syquest. Hope this helps. BTW its a good idea to set the sector size to the MAX for a Plater with no partitions, then any plater you change will work....

Later, Donner.....

Hi

Well I've after someone that wants to part with their Falcon, and swap
it for a Sega Saturn.

The Saturn comes with 2 control pads plus the following games:

Virtua Fighter 2
Clockwork Knight
Wipeout
Daytona USA
Virtua Cop 2
Highway 2000
Daytona USA
Loaded
Panza Dragoon
Sega Rally
Alien Trilogy
Manx TT Superbike
Sega Ages Compilation: Afterburner II, Space harrier & Outrun

There we have it. This is UK machine and am looking for a deal in the UK
only.

Please use the following email address: atari@euphony.net or
atari@lineone.net

I have had an UK 520STFM once, which behaved the same when connected to a "standard" European TV- gave noise instead of sound. In fact, some of the sound could barely be discerned in the noise.

I cured it by soldering a very small (several pF) capacitor between ground and a trace on the PCB inside the RF-modulator can. It was long ago, I did not have the schematics and I did it by trial and error- carefully touching the RF-modulator board at various points to see which would have some effect on sound- a very scientific approach, isn't it :)   Then some more trial-and-error attempts to determine the best value for the capacitor. The sound was perfect after that.

This worked for adjustment to European TV, I don't know about Australia, though.

Cu.

I have a love of Cubase, as I also use it on the PC. It does use a lot of
memory though so you will need to upgrade to 4mb to use it usefully. I also
tried Trackman which is ok. But the only 'in-production' software for the ST
is Sweet Sixteen, the lite version is free, and you can download a copy and
try it yourself, at this url http://w

Brain,

I use a JAZ 2.5Gig and a Syquest 135Meg off the SCSI Port on a TT30 with no problems. Are you sure the termination bar is on the out Port of the SCSI.?? Also set the Sector Size to the largest possible in HDriver, that way no mater what disk you use HDriver will be able to read it.. Hope you get it working....

Later, Donner.....

Right. However, especially for backups you should make sure that your TT's ACSI is really working flawless when transferring big amounts of data.

And if it is not: you can do the same with an external SCSI drive without
- the ACSI adapter just mount a different connector on the box and use a
- dirrefent cable.

Can anybody tell me about Centek's Mode HD adapter? I'm wondering what the installation procedure entails and how to upgrade to 1.44mb floppy afterwords. Centek's web site doesn't say much about it... "Adapter to use 720/1.44 FDD on ST/E and Mega ST".

I'm also open to other methods of upgrading the floppy. As long as it doesn't require me to create the circuit myself (I've tried that already and failed!). Can anyone help me?

Thanks in advance,
Andy Blakely

Hi,
Can somebody tell me more about Centek's Mode HD adapter? What does installation entail? After it's installed, how do you upgrade the floppy drive to 1.44mb from 720k? Just a plain swap or what?

Centek's web site doesn't explain anything except "Adapter to use 720/1.44 FDD on ST/E and Mega ST
". I'm also open to other suggestions/methods to upgrade to a 1.44mb floppy (as long as I don't have to create the board myself - I already failed at that!).

Many thanks,
Andy Blakely

Where can I find a ROM dumper utility for an Atari 1040ST?

I have downloaded Gemulator and I also downloaded 2 versions of

the Atari ROM- 1.4 and 2.6 from
http://www.lgd.fatal-design.com/. All of which work fine with
some Atari programs but I'm having no luck with Megamax Laser C
which crashes my Pentium.

So, the author of Gemulator suggested getting a dumper utility
to download the ROM from my own 1040ST which still works.

Sorry if this one's come up before.

Can anybody tell me why, when I set my STE with superboot 8.1 to year 00 the
system sees it as 1990 when you go to Xcontrol. Is there any way round it.
My Stacy rolled over to year 2000 no problem.

Any help or suggestions would be appreciated.

Thanks to everyone who offered advice on my problem of getting a Maxtor 7213S SCSI hard drive to work in a Mega STe.

A tip from rudy51@newsfeeds.com got me looking at the Mega STe power supply.

I played around with applying the +5 volt supply to the drive before the +12 volt supply and vice versa, and found that the problem was solved by delaying the application of the +12 volts by a few seconds.

To do this automatically, I connected a type-C106 SCR in series with the +12 volt supply lead (+12 volt supply to the anode, cathode to the +12 volt input of the drive) with a 500-ohm 1/2-watt resistor from cathode to ground, a 62K-ohm resistor from anode to gate and a 220-ufd capacitor from gate to ground. With the drop across the SCR, the voltage at the drive is about 11.2 volts, which is within the specified 8-percent tolerance for the drive.

Joe,
   I can't remember where I got my TOS Dump program from, but
www.atarist.com has versions from 1.00 through 2.06 for download. That
should fix you up.

I can understand why Laser C crashes your emulator. Compilers are
usually very designed very specifically for the architecture. Is there
some reason why you would want to run your Laser C programs under the
emulator?

Hi Steve.

Is SCSI better than IDE? I have always thought so, but I don't keep up with Technology. Many people with PCs, don't even know what Scsi is when I say I have a SCSI Syquest, and I want to connect it to their PC so I can transfer files, only to find out they don't have SCSI card, and don't know why they would want one.

I was going to put IDEs into my STs with ide adapter board, as SCSI hosts for the ST, and SCSI II adapters are getting difficult to come by.
I also want to put a much larger IDE into my Falcon.

Later Brian.

Hiya
Just dug out and resetup my trusty old ST for a bit of Vintage computing... got tones of games I never got round to playing.. and low and behold I have lost the driver disk I got with my HD, so now I cannot

format/partion or generally setup the HD :(((

So if anyone out there has a copy of the Gasteiner HD utils disk could they ZIP it up and email it to me PLEASE!!!! or a util that will do what I reqire.. I have tried teh Atari HDX utils but to no avail.. claims the drive is formatted with an old version of HDX and then won't let me format it anyway :((

The machine I am using is a 1040 STe... anyone know what revision has the duff DMA chip (original HD machine is my STfm which is still buried in a box somewhere and missing a PSU).

Any and all help much appreciated.. spesh if someone can supply me with that disk :).. the controller card is a G-Soft (GE-Soft?) card as supplied by gasteiner with their Drive Kits.

Hope to hear from someone soon.

Graeme
(email driver files to me at graeme@the-crow.co.uk) PLEASE!!!

This is not a pc so you if it's already formatted there is no need to
do it again.

Have you tried to manually run AHDI.PRG from floppy by double click in
the desktop. Then you will have to manually install the C:\ drive icon.
Note that SHDRIVER.SYS and AHDI.PRG are identical files. Maybe you have
a copy of the diskutilities on the harddisk!?

Try a "computer music" store. They will know why SCSI drives are better
for HD recording etc. They will probably be able to sell you a card as
well.

Generally pc shops know very little about pc's. That's why the want to
sell them:-)

If you know about C compilers I suppose you also know how to setup a
newsreader properly: Turn off the html rubbish!!! And while you are
busy with this, try learn how to quote properly.

Check your ST's TOS version. If it says 1985 it's 1.0, 1987 is 1.2 and
1989 is 1.4 and download the same version. Really no need for a dumper
utility as most TOS versions are available.

Start the emulator in "Atari disk mode" and set it up to boot from
floppy and in monochrome. Now put in your normal boot floppy from the
real ST. Keep any original floppies writeprotected as Win-95/98 also
writes to the floppy when reading (SIC!).

If this does not work then you are probably out of luck. Gemulator 2000
is generally very good but you may also try a more "games oriented"
emulator. Sorry, I don't remember any names.

Hi!

Disaster has struck me and that the PS on my Falcon has died and it just eats the fuese from now on. I am in the USA so,

1.) Can I use a C-Lab MK II PS on it

or

2.) Can I use a 1040STe PS on it.

Regards,

Jim W. Krych

Hi again Brian

>   Is SCSI better than IDE?

It certainly is, mucho faster..

>I have always thought so, but I don't keep up with Technology.

>Many people with PCs, don't even know what Scsi is

A PC owner with a brain is a lemming.

>   I was going to put IDEs into my STs with ide adapter board, as
>SCSI hosts for the ST, and SCSI II adapters are getting difficult to
>come by.

I think with the speed of the basic ST you'd not notice any difference,
but when you hop up the processor a touch you'd notice.

>I also want to put a much larger IDE into my Falcon.

I put a 10Gig into a falcon a few weeks ago for a fellow club member, he's
happy. 8~) Actually i did another as well, that one was 6 or so GIG as i
recall. He's smiling as well..

It could have been done with basic HE10 connector
(with one more connector on each cable), couldn't it ?

What are the expansion boards shown on the photos ?

Actually I haven't gotten that far just yet.

I am using the program ID check. I just want know if the TT is seeing the drive. I figured there was no point in continuing further if it doesn't.

The setup is now as such.

Internal SCSI drive ID 0
External ACSI drive ID 0
External SCSI drive ID 2
External CDROM   ID 5

So I figured that the utility IDCHECK would identify working devices in the configuration above?

The internal SCSI is detected.
The External ACSI is detected.
The External SCSI is NOT detected
The External CDROM is NOT detected, (But it works, and is identified as
                                    (device #5 by Extendos)

So, I need to understand why the 270Meg Syquest is not being identified by the ID check program? I would assume, and I have, that HDUTILITIES will bypass the Syquest in auto configuration just the same.

Currently the TT is set up with ADHI and my intention was to have the Syquest detected, then install the HD Driver BootStrap for all devices.

Now, connected to my Falcon as either device 0 or device 2 the syquest is detected by the IDCHECK program. Just the same, the CDROM is not Detected with the IDCHECK program. I thought that the IDCHECK could determine what devices are in use or at least what ID #s are being used for all devices.

As this seems the easiest way to sort out conflicts and problems. Perhaps I am going about things wrong.

But I don't load HDUTILITIES until I really am going to use them, as I know I will do something I may regret. Well, at least not until I back everything up anyways:-).

Brian.

Your delving into something here which has changed considerably on the PC hardware, especially with the move on from UDMA etc.

SCSI speed was de-facto for hard disk recording on PC's, though it was always dependent on a decent SCSI card, and most serious musicians using a PC know this, though depending on which SCSI you go for on a PC, SCSI-1 / 2 Wide etc, and what the card is put in PCI / PCI Master or Slave positioning, ISA etc, you can actually loose out instead of gain.

Also hard drive speed is a matter of a few collective things, so just seeing the rotation speed of a drive can be *very* misleading, as some drives read on every other rotation for example, but people sometimes will buy just on that.

You could and still can buy purpose built "audio" or multimedia hard drives for the PC, but its really not needed as long as your PC is setup correctly, and the difference between a SCSI and a modern IDE drive / motherboard on a PC is minimal, its actually things like MMX that cripple most audio recording and access speeds, because of the constant flipping in and out of the FPU. I dumped a 400 because the speed for recording was far better on a normal Intel 200, why......NO MMX or other multimedia extensions......

I get 12 to 14 tracks, perfect synch audio with a PC and VST and a terractec EWS64XLS, peachy.......though..........I still have to use my trusty Atari to get perfect MIDI synch......go figure....

Best regards,
Greg

The main differences between SCSI and IDE don't have anything to do with
hard disk recording etc. There are so many thing where SCSI is superior
to IDE that it's impossible to explain them in a few words. Just by
looking at the specifications without even reading them you will find
that the SCSI specification is several times larger than the IDE
specification.

Any device should be detected if properly connected. If I remember
correctly your version of HDDRIVER/HDDRUTIL is quite old. What does the
ID check of the current demo version say:

>The main differences between SCSI and IDE don't have anything to do with
>hard disk recording etc.

Quite correct, but I *was* giving an example of the performance of SCSI and IDE in relation to hard disk recording just as part of the discussion.

And as I said in my statement most serious musicians using a PC and a piece of harddisk recording software choose SCSI, and as you state it is not possible to explain all in a few words, so only examples can do, if we decide that topics shouldn't be explained or looked at unless it takes a few words, then maybe we should not post opinions and experiences?

Anyway, I will re-quote myself

"SCSI speed was de-facto for hard disk recording on PC's, though it was always dependent on a decent SCSI card"

though I still say the difference in performance is minimal with todays drives, on a decent PC.

>>There are so many thing where SCSI is superior to IDE that it's impossible
to explain them in a few words.

Quite correct again, but I was talking in relation to my experience of harddisk recording, and not the specification of the two devices. ObviousIy if I was giving an example in relation to running oracle on an NT server with 20-30 users, I may change my opinion.

As for specifications, they are always better on paper, thats what they tell you with MIDI synch and the Terratec sound card on a PC for example, but the fact is synch on the Atari is better, so specification plays no part.

Actually I feel here as if I am defending PC's and IDE etc, which is not the case, I would much prefer to afford a Milan or similar, but at the moment for harddisk recording I am stuck with a PC.........of course there is always the lottery......I must buy a ticket this weekend<s>.

Regards,
Greg

Are you sure about this? There was an article in /ST Computer/ some months ago where the author said he couldn't get direct to disk recording to work on his Falcon with an external SCSI, but all was well with an internal IDE (which is what the software maker recommends anyway). Of course, one does npt know whether his SCSI was one of the older, slower ones...

>I put a 10Gig into a falcon a few weeks ago for a fellow club member, he's
>happy. 8~) Actually i did another as well, that one was 6 or so GIG as i
>recall. He's smiling as well..

Yes thanks, Steve, my 6.4 GB is working very nicely. But I had to strip down to the Falcon to the PCB yesterday and resolder the monitor socket pins to the board, as I was getting intermittent sync on the video which could be cured by waggling the connector - obviously a dry joint. Seems to have cured things (FX: fingers and toes crossed!).

>Syquest detected, then install the HD Driver BootStrap for all devices.

If you are using AHDI, this will stop looking for devices when there is a break in the numbering. Try setting the external SCSI ID to 1 and the CDROM to 2 and try again. Or use HDDRIVER, which doesn't have this restriction.

BTW, there is no need to keep the previous poster's sig at the end of your mails, as you seem to do regularly. :-)

Regards, /Peter/

```

Using mixed ACSI and SCSI is theoretically possible, but I'm afraid that I've no experience of it at all.

Is there a reason why you want to use that ACSI bus, I'd be inclined to simplify it by keeping to the TT's SCSI bus alone.

>But I don't load HDUTILITIES until I really am going to use them, as I know
>I will do something I may regret. Well, at least not until I back
>everything up anyways:-).

I think that you're doing HDDriver a disservice - load up its utility prog and tick the boxes for the drives you have connected. Drag them around to get the boot order right (you'll need to do this to keep your partitioning scheme in the right order, or the C: drive might end up assigned to the wrong drive). Reboot, and that's that sorted.

Rgds, Derryck

On the Falcon, IDE will probably be quicker because Falcon SCSI is so shitte youre lucky it works at all.

The Falcon is a special case regarding SCSI/IDE speed. Modern IDE drives are usually faster than SCSI drives *when connected to the Falcon*. This is caused by the Falcon's SCSI/DMA hardware limiting the transfer rate to appr. 1.8 MByte/s. With the Falcon IDE transfers are not done by using DMA (the Falcon's hardware doesn't support IDE DMA) but by programmed I/O, using the processor to read/write data from/to the IDE port. The faster the processor the faster the data transfer. Even a Falcon not accelerated somehow can provide IDE transfer rates > 2 MByte/s this way.

Hi Steve!

Only a guess, but could it be linked into MagiC 6's ability to have a
picture displayed at bootup?

Cheers!

James

No, you definitely do not need to hook into any system vectors to read/write
MIDI data - simply use Bconin, Bconout and the corresponding ...stat
routines *since the in/out are blocking).

Hi!

I am planning my first demo for the Falcon030, using Stos for the Falcon!

I would like to do some "3D" scrolling similar to the famous Star Wars opening. This must be callable from STOS. I would just like to have some text scrolled that way, it will be the ending credits.

Thanks for any help gang!

Regards,

Jim W. Krych

How easy is it to upgrade the ST RAM portion of a TT? Could 2 MB be
easily upped to 4 MB by just popping in 1MB DRAMs, or SIMMs?

Thanks...

Jeff Thomas

This may not be much help but on the Falcon you just pop it in.
Simple as that. Do you have some prg/cpx to look in the cookie
jar? Soon as I put the FPU in the Falcon a new '_FPU' cookie appeared.

The TT uses a custom daughter board to add the ram. That's probably
not what you wanted to hear.

Hi Jeff!

Basically, you can only modify the ST-RAM card one way: to 8 MB.
Details are at the page below...

Greetings,

I am looking for emulation packages that run on W98/NT4. In particular, I am looking into running it on a W98 laptop.

GEM2000 by Emulators, Inc. seems to require either a hardware extension with the TOS ROM's plugged in, or the TOS images on disk. For laptops, they recommend the disk image.

Are there any TOS utilities to extract the TOS image from the ROM? I don't know which version it will be, we have several different ones we may have to try.

What are the image requirements (Lo, Hi, headers etc?) I may be able to write such program (I forgot if the ST let you access the ROM contents without giving you an access exception - and I also don't know what address the ROM started and where it ended). Information would be very appreciated.

If you were looking for an archive, which ftp site would you look at these days?

Help is greatly appreciated.

Best Regards,

Mustafa Soysal

G'day,

I recently bought an old Atari 520STFM for NZ $20 (around US $10). It's diskette drives appears to be deceased, and I have connected up a Mitsubishi MF355F drive, having changed the driver ID to unit 0 (through jumper settings).

The drive appears to be functioning, however I'd like to know if there is anything else that I should be doing to make this work? Can my ST be made to recognise 1.44M diskettes?

Also, can anyone tell me whether the 520STFM with PAL Television output will work on the Brazilian PAL-M system?

Thanks

Paul Cull

I've just been reading my way through an Emulator FAQ at
http://members.aol.com/rg1004/atstemu.faq.html which gives some ideas, and
URLs (which I haven't had time to try yet).

I'm looking for the same thing..an ST emulator I can use on an old 486DX to
develop software for an ST520 that I've just bought.

Does anyone know of a good free programming environment (Basic or Pascal
prefered) for the ST?

Thanks

Paul Cull

Actually, some of the links in that FAQ are old. The Little Green Desktop at http://www.pacifist.fatal-design.com/ is probably the best place to start an emulator pilgramage, IMHO.

Paul

I don't know if GNU has Pascal, but their gcc was pretty good for command
line programs.

Is Make disk for the PC or the ST? Is there one for both? How do you make a ST with an Atari ST?

And is this a TECH Question?

I am not certain but I would like answers out of curiousity.

Boy, you sure a draining your bank account with an offer like that:-).

I figure it is sold. I emailed the poster when the message appeared, long before you post showed up. And I never got a response. I would have picked it up. These are hard to come by. Don't know what I would do with it however.

Well, yes there are. One is called ST Xformer, and is available on:
http://www.emulators.com/

The other is (I think) Falcon-specific, and it's available on:
http://cas3.zlin.vutbr.cz/~stehlik/a800.htm

Both will be _very_ slow on an ST though.

I purchased a 1040STf in non-working condition, and I am rebuilding it with parts i have from others. Why rebuild a non-working, used STf, you may ask? Well someone spent time on this one, and I have no idea what all they have done to it to enhance it, but it has some add on boards and wires soldered, so I will describe the mods and hopefully someone can tell me what they are, and exactly what i have here if it is worth resurrecting. Here goes:

A ribbon cable and header has been soldered ontop of IC U19 and the board at the other end of this cable reads: Practical Solutions Tweety Board Ver 1.4 1988

IC U9 is missing (don't know if this was required for an upgrade or what, should i add another?)

The small rf sheilded box in the middle of the st motherboard has the top removed and a small pc board with the writing ST4096C (c)1989 John Russell Innovations, has replaced an IC and the IC appears to now be plugged into the new board next to an empty socket also on the new board, and from this new board runs a ribbon cable to yet another new board that is labeled simply RAM+ TYPE C again John Russell Inovations (c)1990, I assume it is somesort of memory upgrade, it has the provisions for what looks like 4 30 pin memory modules. U46-U61 of the memory onboard the st motherboard has been removed and various wires are soldered to the st motherboard at various points from the upgrade board. There is no memory on the add on board.

I have not tested this yet because it is missing the system power supply, a floppydrive, and a keyboard. I have all of these components laying around if someone would please explain in detail what these enhancements do and how they work. I am really anxious to get started on this project.

Thanks in advance

BG

Hi All,

I am trying to get an atari 7800 i just bought to operate well.

Presently it works but with alot of noise overlayed on the picture.

the 2200 uF 16v capacitor on the board had ruptured so i replaced that
with no positive effect. Next i hooked the system up to a battery power
source still thinking that the noise could be comming from the power
system. But running on batteries made no difference.

So my questions are:

1. Does anyone have any pointers for me on how to proceed
trouble-shooting?

2. Does anyone have an atari 7800 that they want to sell so i can use
these cool games i have for the unit?

thanks alot,
nick

I believe the Tweety board is to get stereo sound out of an STF.
I may be wrong but my friend had a Tweety board that did this.

Hi Steve

>Do I need to set a dip switch for the Mega STE to see a FPU co-pro?????

You may need to set some links and may need either to fit a GAL chip or
fit a modified GAL in place of an existing chip.

What's the problem? Everyone with an Internet account can send mails to
someone on the Maus.

Did you try a few other things like:

Manually adjusting the fine tuning on your TV?

Making sure you got the right channel? (3 or 4)
Try a different RF cable?
use a different switch box? I found some older switch box to be rather
bad. Auto RF is not a good idea for systems like 7800.

If that all fails, you *could* have a bad video circuitry on your 7800.

Are you sure it's NTSC ? I assume you are in US, as I have the same problem
with NTSC consoles on my PAL TV. I vaguely hear the sound beneath a lot of
noise

I received a message back from the seller and it was only up to $300. It most likely went for even more since the last one I seen someone selling went for $800.

Hello,

This system has just about everything you could ever want in a 64-bit Atari Jaguar system, it even has a built in lightshow that performs with your cds. It comes with Console w/cords and in box, CD upgrade w/cords and in box, and 12 games most in boxes including Aliens vs. Predator, Rayman,
Mutant Penguins, and others. Take a look at it:

Yes, especially when you can get a working STE for 40 or 50 Euros.

The tweety board is a rather useless a poor quality sound enhancement.
It adds pseudo-stereo to the YM soundchip output. The STE's DMA sound is
far better. I don't know of any software that took advantage of the
tweety's other features.

Sounds like a SIMM upgrade. Might be 1 meg or 4 meg. Again, the STE uses
SIMM RAM as standard. The other board on the video shifter might be an
overscan mod. This requires additional software and is usefull only for
some cleanly coded GEM programs.

Get a cheap STE. That way, you can try swapping the missing components
from it. If you are satisfied, you can keep the modded STF, otherwise,
you can still use the STE.

Well this doesn't have much to do with which newsgroup you're
reading, but...

> to send email to someone whose
>only address is in MausNet (sp?), please?

Long ago, :) you'd do: user_name@hostname.maus.de

I.e. replace spaces in the username with underscores and add
a .maus.de after the (two oder three letters/digits) hostname
(and first remove any spaces maus users sometimes(?) place around
the @ when they post their internal addresses). I don't remember
having mailed to such an address for quite a while but chances are
this is still how it works.

Btw back then their internal mail protocol was quite primitive
compared to what we're used to with rfc822 and friends (yeah thats
NIH for you :/), so don't expect things like mime, Cc, Reply-To
or even bounces to work right, and best not to send more than a
few K of plain text at a time. should the mail fail for some reason
after it has entered the maus network you may never notice! also
don't count on formatting or things like tabs not getting munged
in the transformation...

Oh and while we're at it, does someone know a publice nntp server
that still carries the maus.* newsgroupus after their big group
renaming a while ago? a readonly one is enough, postings in those
groups often didn't make it into their internal net anyway.
(they only had a single gateway for that direction at least, because
their protocol also couldn't handle `normal' message-ids!)

HTH,

As some of you may know I am working on a SCSI ethernet adapter for use on the Atari. It should also be usable on ST's with a SCSI adapter attached to the ACSI port.

I have the ACSI documentation which I will refer to later, but before I work on the ACSI-specific issues I wonder if someone who is familiar with the subject could give me an overview of the differences between ACSI and SCSI. I gather that in the case of ACSI the target does not control the bus phases and that the initiator, not the target, must determine the amount of bytes to be transferred. Are there any other prominent differences that I should think about?

In view of the above, how do the common ACSI-SCSI adapters handle these differences? (E.g. what happens if the target tries to transfer a different amount of data to what the initiator is expecting?)

```

No. I wasn't, the simms are not a problem.

> If you mean the Marpet Xtra RA boards the speak to System Solutions on
> 0208 693 3355, Karl has the boards made now i believe.

I might be, i'm not sure, as I have just stepped back from a PC background
into the atari scene so I am treading water a little.

I have an old 1040STFM which I would of liked to have upgraded the memory
and TOS. I think the TOS is pre 1.04, and the memory it seems requires a
daughterboard. But I will give System Solutions a call anyway and see what
they say.

Thanks,
Greg

Yes, this is correct. With ACSI the initiator has to make a guess on
what will be the next bus phase. (Note that as far as I know except for
CBHD and HDDRIVER all other hard disk drivers for the Atari do the same

for SCSI, i. e. they don't work target-controlled.)
There is no initiator identification or bus arbitration except for the LINK96/97 host adapters that support initiator identification by hardware on ID 7. ACSI doesn't allow certain SCSI command class since only the lower 5 bits of the command byte may be used for the actual command data. The upper 3 bits are reserved for the SCSI ID of the target device. ICD compatible host adapter offer a workaround for this so that all command classes can be used despite this difference between ACSI and SCSI. You can't use SCSI messages with ACSI, which means that a SCSI-3 compatible LUN selection is not possible and several advanced SCSI features based on messages are not possible.

> In view of the above, how do the common ACSI-SCSI adapters handle these
> differences? (E.g. what happens if the target tries to transfer a
> different amount of data to what the initiator is expecting?)

In this case everything might be screwed up. The initiator can't react since it doesn't know what exactly happens on the bus. The DMA hardware might accept some bytes more than actually were expected but this depends. In other words: The target must transfer exactly the amount of data the initiator expects, otherwise the state is undefined and most likely the bus will be blocked.

We all have access to groups named ".maus.de" at end.
These are Mausnet groups, but not all, only a handful groups avaiable by
an gate. Mausnet requires real names.

Nicholas,
Is there any way to find out if this is a 1 meg or 4 meg upgrade, i want to
get some SIMMs for it but am unsure which to buy (4 256k or 4 1meg SIMMs)

Thanks,
Brent

It's far easier to upgrade the TT-RAM, at least if you happen to have one of
the TT RAM boards with sockets.

Hi

The time has come to link my Mega STE to my pc's. To cut down a lot of hassle, as time is limited for me at the present, I need to know how and what I need to do to connect it to my network!

I've forgotten what make the card is, but it fits in the internal slot on the Mega STE. I'm using BNC (thin coax).

I have tried briefly with STinG, but it just bombs out:(

So I'd be grateful to know what software I need, STinG, HSmodem etc...., and any info that would be helpful.

If I can get this working it will speed up waffling through the mountains of disks, formerly LAPD PD library, I have around me as it should cut out transferring onto another hard drive or removable media.

```

Hi Brian,

As you know Hayes set the standard.

I use ATZ as the init code.
I dont use Connect any more or any BBS, but will send you all my Connect data and my Default.CFG and Dial.SCR for Zetnet ASAP.

Bob King.

Hi,

In comp.sys.atari.st res <res@sympatico.ca> wrote:

>> What is the maximum TT RAM expansion?

> 8 megs, but there are some 3rd party cards that go to 32M and beyond
> you dont need to expand a 4-meg machine to run Cubase

Newer TT-RAM cards allow for more RAM. They use PS/2 SIMMs.

>> What is the maximum ST RAM expansion?
> 4meg and 3rd party cards (i think)

With 3rd party cards you can have 10 MB ST-RAM.

>> What kind of SIMMs (if at all) does the TT use?
> i dont know
> dont waste your money on the TT, just get it up to 4 megs

? Weird answer ...
It should be up to oneself to decide how much money to spend on one�s own TT.

TT-RAM cards:

Mighty Mic: 30 pin SIMMs, up to 32 MB
AIX TT or Magnum TT (not quite sure, which one): PS/2 SIMMs, up to 256 MB(?)

ST-RAM might be more difficult to find. It�s a comparably huge board you have to exchange.

>> Is the TT networkable to a Macintosh G3? How is this accomplished? What
>> protocal is used?
> dont go there

The TT is the best Atari to do network stuff with. The major problem will be to find an ethernet card. Since the G3 doesn�t come with a serial interface you can�t use the slow null modem connection. There are at least two possiblities, both cards use the VME interface (located behind serial 1 and 2): PAMs Net - drivers for this card are only available when using Mint as OS. The other card is the Riebl. Here you can use STinG under MagiC or PlainTOS with an appropriate driver. Protocol would be TCP/IP. FTP, telnet, e-mail and newsgroup clients as well as a browser(s) are available.

Since the Riebl has BNC and AUI only, you will need a transceiver AUI to twisted pair (and a cross patch TP cable) to connect the two computers.

Your major problem will be to find such a card. They are no longer manufactured and highly wanted (and comparably expensive).

>> What is the theoretical transfer rate (mbits/sec) of TT <-> Mac
> networking?

Perhaps 2? Even if you use 10BaseT, I don�t think it reaches the maximum speed (as well as other computers).

>> When networked, is there a way for the TT to access my Mac G3's adsl

> connection?
> why? internet on the Mac exists

I am not too familiar with additional networking soft for the Mac, but I guess it would be necessary to install something like IP-masquerading on the Mac. I only know this for Linux. But I guess you�re not too keen on to learn how to handle a Unix.

>> What is the largest capacity harddrive that the TT can have internally?
> ask Uwe Seimet for the correct answer

I�ve heard that even 9 GB would do. But you need the newest HDDriver (Uwe Seimet is the author).

>> How many SCSI devices can the TT SCSI controller access?
> 8 i think

The SCSI controller can address 7 IDs (0-9). If you want to use one for your computer (usually no. 7), you can hook up 6 additional devices.

>> What solutions are there for accessing multiple SCSI devices on the TT?
> hook them up and make sure your weird-behaving SCSI devices are last

You apply the usual daisy chain principle. Look for proper termination. If you want to use a lot of external devices, it might be necessary to fiddle a little bit to motivate the TT to support term power on its SCSI bus. Since TTs have DB 25 interface, you might need adaptors for newer drives (TTs have SCSI 1 only). If you look for internal harddisks, don�t use Quantum Fireball 1 GB, the TT cannot boot from it (As additional harddisk it works fine.)

>> Is the TT easily moved into a PC-style case?
> dont waste your money, just put a front-panel power switch on it

I wouldn�t do this either, it�s too much fiddling around. Get one of those beasts with several plug-ins and a power switch. You just switch it on and all devices start up at once. It works fine for me. If you don�t want to have heaps of cases crowding your computer table, get a bigger one for your external devices.

Regards,

Kerstin

Does anyone have any pointers to information on how to
```

use the MIDI interface of an ST in assembly? Preferably
documentation, but working source code may also do the trick.
I'm trying to read MIDI input with the (perhaps overly
enthusiastic ;) intention of turning my old ST into a
MIDI-CV interface.

Many fax modems will not operate above 19200 DTE. Try resetting your DTE
speed and try again.

Thanks for the responses Brian, I will take a look at the archives, and I am
thinking of just upgrading the SIMM machine ( 520STE I think), as I can find
nowhere that supplies atari daughterboards in the UK.

Regards,
Greg

>20-layer environment. Unless you are sysex and controller happy

Yes. Lots of sysex and controller data. But, if the automation fades were performed in ProTools, then that would bring my RAM requirement down greatly...and improve resolution to 24-bit!

<snip>

>> All I want the TT to do is MIDI. That's all! I'm sick of the

>> horrible automation that Logic Audio provides.
>Pardon? What about the timing of midi on the Mac? Why not get another
>cheaper Mac
>that allows you multiple screens, current versions, etc? Even an iMac would
>work

Mac MIDI interfaces are serial devices. The MIDI data is sent out one byte at a time. With the Atari (and specially ExPort) the data is sent out in parallel.

Have you ever used OMS? I sometimes have to correct for a 20ms delay.

>And they are bloody cheap
>I use Logic for all my automation, with Cubase as the main sequencer
>Call me crazy

You are crazy. For me, Logic's automation and audio is sub-par compared with ProTools. Steinberg has dropped Cubase TDM.

>> PC style cases are cheap. My G3 is in a rackmount already.
>Please tell us how you rackmounted your G3. Did you do it yourself?

The rack I used is from Marathon Computer:
http://www.marathoncomputer.com/pr_prg3bw.html

>
> Does Cubase or Notator (original or Logic) work with the TT?

Yes, except Cubase 2.0 maybe.

> Would they run in ST or TT mode (if there is such a thing)?

No such thing. They'll run at the TT's max speed.

> Would they use TT or ST RAM?

Dunno, but they should NEED more than 4Mb anyway, so ST Ram is ok.

> What is the maximum TT RAM expansion?

256Mb I think, but not sure. The main question is where to find such an extension.

> What is the maximum ST RAM expansion?

14Mb.

> What kind of SIMMs (if at all) does the TT use?

It doesn't. It needs Atari RAM boards.

> Does C-Lab's Unitor2/ExPort MIDI expansion interface work with the TT?

Don't see why it shouldn't

> Does Steinberg's MIDIEx work with the TT?

Same here.

> Is the TT networkable to a Macintosh G3? How is this accomplished? What
> protocal is used?

Not really. It probably can be done, but it's not very practical. The TT has an appletalk serial port. With a TCP/IP stack like STinG you can probably get started, but this is serial, remember.

> What is the theoretical transfer rate (mbits/sec) of TT <-> Mac networking?

Serial is 115Kbps.

> When networked, is there a way for the TT to access my Mac G3's adsl connection?

STinG supports IP masquerading. At those speeds though, would the TT benefit of an ADSL connection ?

> What is the largest capacity harddrive that the TT can have internally?

Several gigs. SCSI of course.

> How many SCSI devices can the TT SCSI controller access?

6.

> What solutions are there for accessing multiple SCSI devices on the TT?

There's a fiddly bit. I beleive it's tricky to mix external SCSI with internal SCSI.

> Is the TT easy to rackmount? In other words, is the motherboard small
> enough to mount in a standard rackmount case?

Dunno. You would have to measure it.

> Is the TT easily moved into a PC-style case?

Dunno, it would probably have to a big tower.

> Thanks in advance.

> Does Cubase or Notator (original or Logic) work with the TT?

Notator, no. Logic and Cubase, yes.

> Would they use TT or ST RAM?

Probably ST ram, since they are hardware-intensive.

> What is the maximum TT RAM expansion?

Theoricaly, 256 MB, based on the 68030's addressing capabilities. Atari made a 16 MB card and Aixit 64 and 256 MB.

> What is the maximum ST RAM expansion?

Theoricaly, 14 MB. In practice, the motherboard has 2 B, then you add Atari's 2 MB or 8 MB n top, for a total of 4 or 10 MB.

> What kind of SIMMs (if at all) does the TT use?

The ST ram card has its ram chips soldered on.

TT ram uses 30-pin FPM or 72-pin SIMMs, depending on which brand.

> Is the TT networkable to a Macintosh G3?

The TT can do TCP/IP, using MiNT-Net or STinG. If the G3 has a RS422 serial port, you could use a Mac printer cable as a nullmodem.

> What is the theoretical transfer rate (mbits/sec) of TT <-> Mac networking?

230400 bauds on the RS422 port.

> What is the largest capacity harddrive that the TT can have internally?

Assuming you use the standard TOS 3.xx, up to 14 partitions of 512 MB each.

> How many SCSI devices can the TT SCSI controller access?

All devices from ID 0 to 7 are supported.

> Is the TT easily moved into a PC-style case?

Using an old style AT case, yes.

> use the MIDI interface of an ST in assembly? Preferably

Tos has some routines in the BIOS section that you could start with.

To check if the midi port has something in it's input buffer try

```
nothing_for_us:
    move.w    #3,-(sp)
    move.w    #1,-(sp)
    trap    #13
    addq.w    #4,sp
    tst.l    d0
    beq    nothing_for_us    ;go look again
;midi input is waiting for us to collect.

;collect value
    move.w    #3,-(sp)
    move.w    #2,-(sp)
    trap    #13
    addq.w    #4,sp
;midi value is now in D0.L
```

From memory I did this ages ago and each note appears to give two values into the ST. I presume it is the note and velocity of keystroke. My keyboard has not got velocity control so I always got a $FF then a note value. When the key was released I got a $00 then a key value.

Hope it helps

Mark

You can get in at a lower level too. For example you can handle the interrupt generated by the MIDI chip when a MIDI byte arrives.
You can do interrupt-driven output too if you like.

The info you need is in the old Internals book. If you need examples let me know and I will fire up the old ST.

Hi, I've got a question about the STFM1040's joystick port, namely what kind of joysticks can you use in it? Can you use a C64 one or an Amiga or IBM one????

Thanks in Advance

Next Question:

I was told that only mono monitors can display high resolution, is this true?

Also If I buy one of those cables that will allow me to use my PC
monitor will it do mono or color and what resolutions?
Are there any that will do high-res. Color? I have been looking at the one
at best electronics.

I got news for you - MIDI is a serial protocol. Part of the MIDI spec
is for an opto-isolated FIFO arrangement at the receiving end of
anything that expects to see MIDI - it's always serial.

Yes, Amstrad, Amiga, C64 etc all used "Atari Standard" joysticks. The
same as used on the VCS 2600.

IBM ones are analog, so won't work.

Yes. Check out the Quick FAQ.

There are 3 resolutions: mono hi-res (640x400), 4 colour mid-res (640x200), and 16 colour low res (320x200). The only usable one nowadays is mono. Colour resolutions are only good for games.

> Also If I buy one of those cables that will allow me to use my PC
> monitor will it do mono or color and what resolutions?

It will do mono on a PC VGA, no colour.

> Are there any that will do high-res. Color? I have been looking at the one
> at best electronics.

No, this can't be easily done because of the low scan frequencies involved with colour. But you can use a TV for the colour modes, either if you use SCART in your country, of if your ST has an RF Modulator (STFM or STE)

This is all in the Quick FAQ.

SS> whinges for it.

This is part of MagiC 6, a shared library which I would suppose have something to do with image handling. As far as I know you do not have to have this configured in magx.inf - the only shared libraries mentioned in my magx.inf are

```
#_SLB 0 WINFRAME.SLB
#_SLB 0 PDLG.SLB
```

in the #[aes] section of magx.inf. I suppose also, that if MagiC needs it, it knows where to look for it (in the GEMSYS\MAGIC\XTENSION folder).

Regards,

Atari ST, Amiga, Atari 8 bit, Commodore64 all use the same joysticks... namely the same one that people used on the Atari 2600.

I've never seen an IBM joystick with the same style adaptor. The closest would be something like the stinger, which has a db9 serial adaptor. And no it won't work in your 1040ST's joystick port.

You are both correct here:

1) MIDI _is_ a serial protocol.

2) Using the Export output expander, it is multiplexed from the
   parallel Centronics (to which it connects) to three MIDI OUTs.

Just for completion, the LOG3 follows the same paradigm (parallel to multiple serial) by connecting to the cartridge port.

Yes. I know this. I am referring to how the MIDI data is sent to the multi-port MIDI interface in the first place. On the Mac, when data is passed to a multi-port MIDI interface (such as a Opcode's Studio 4), it is sent out in serial (via the serial port or USB). On the Atari, when a multi-port MIDI interface is used (such as C-Lab's ExPort), it is sent out in parallel (via the 8-bit parallel printer port). When the two are A/B'ed, a noticeable timing difference can be heard amongst critical tracks (such as rhythm tracks and ones that contain large amounts of controller data)!

Unfortunately, there are no PCI-based multi-port MIDI interfaces in the market for the Mac.

I will see If it acknowledges the change properly to 19200. But then why is it a 28800 Faxmodem?

I am still confused between baud and DTE. I grew up with baud, and when I
came back to computing, everyone talks DTE.

Thanks Roger

Note that this will only work on 100% ST compatible machines which have an
ACIA-driven MIDI port. If you want portable code, use the BIOS routines as
long as possible.

:-)) "Manufacturer's speak" - they will quote the largest figures they can get away with! I had a similar prob. to yours on a Zoltrix fax modem. It wasn't until I read the fax-manual (only available on-line) that I discovered the 19k2 restriction.

> I am still confused between baud and DTE. I grew up with baud, and when I
> came back to computing, everyone talks DTE.

Steady, Brian! Don't fret. The DTE (Data Terminal Equipment) i/f and the DCE (Data Communications Equipment) i/f are just used to describe the two different data highways on the IN/OUT of a modem. (The DCE speed is usually automatically negotiated between the ISP and your modem).

"Baud" is still OK as a measure of speed and could be applied to either DTE or DCE.

Have a good Xmas :-)

Roger

dear ray: i would like to get a 1040st from you, if possible. i am
looking to keep 1 to always be able to access older music works in
progress materials, even though i intend to upgrade my music software
to a windows based program in the imminent future. if you can help me,
i won't need a monitor, as the one i have works great.

<h3>e-mail: atari@benjamin.net

I'm looking for the author of some Atari SoftWare and I could use your help. He's one of the Authors of FreeZe Dried Terminal, He's the Author of UBBS and ForeSight BBS Software and his Software Company is called FreeZe Dried Software. His name is Brian G Hauer. I'm a registered user of some of His Software. On top of that, I recently sent Him a bunch of Atari Jaguar Hardware & Games & a 7 CD Changer CD ROM. I was expecting to receive extra & special support. Instead, soon afterwards He dropped support of my Software. Now, I'm not asking for a refund or a return of the extra stuff I sent Him. Still, I would like to receive the support and special attention I'm entitled to. Brian G Hauer lived/lives in California. His Parents/Family still do. His parents Phone is in the (310) area code. Nobody there returns my Phone calls & the only answer I get is their Answering Machine. Last I heard, Brian was getting His College/or better Education in California. I'm guessing USC/UCLA. I would appreciate information such as an E-Mail Address, Phone Number or even an Address. Please, if someone out their knows Brian or knows His whereabouts. Please E-Mail me or call me at: (503)256-9974. And Brian, if your reading this, E-Mail me at: atari@benjamin.net or please call me!

Are there 8bit emulators for the older ST's (I have a 1040 ST and a 520 ST with no harddrives). I have a bunch of 8bit stuff, but limited room, so if I can get my ST to do the work of the 8bit as well, it'd be really nice.

Thanks!

1) Why?;-).
2) Use 720K DSDD floppy Disk. (Also called 1Meg Floppies in other countries)
3) Format on the PC if your ST doesn't have TOS 1.4 or Above.
4) Copy Files from ST to PC.
5) If your ST doesn't have a hard drive, and you have your midi files on ST formatted floppy, you will have to do File copy from the ST disk to the PC formated disk.
6) There are utilities to format 720k disks readable by the PC. These can be found at http://www.umich.edu/~archive/atari
go into the Utilities section. Again this is if your ST is older.
7) You can use Serial connection btw the PC and ST, get a null modem cable, and run a terminal program on the PC and one on the ST.

I hope this is a start for you. By the way, should you want to transfer files from the PC to the ST, again, use Double Sided Double Density disks, and copy the files from the PC to the disk and insert into your ST.

As my friends who have changed to the PC have returned to the ST for midi, because of some less than happy result.

Hope this helps.

Are you saying the bit resolution is ram-dependent on PT?
In that case it would seem ram is the answer?

Unfortunately I spent 5 minutes with it and gave up. Get an SMP-II for the
TT
and that's it. For Cubase I mean. Or else get the Log3/Unitor2/SteadyEye
combo
for Logic.

> >And they are bloody cheap

No, Cubase 2.0 does not run on the TT. 2.0 runs on TOS 1.4, 1.2 and lower.

To build, colorised schematic -> DOIT_ST
URL below.
To buy, i dont� know, ask BEST Electronics.
URL below, out of the link pages from my web site.

Regards, Robert

No.  I'm saying that MIDI has a resolution of 7-bits whereas Pro Tools
mixer automation (which is not dependant on MIDI) has a resolution of
24-bits.

>Unfortunately I spent 5 minutes with it and gave up.  Get an SMP-II for the

Actually, synching the TT with my Pro Tools equipped Mac via SMPTE would
be foolish since MTC (with song-position pointer) provides greater control
and accurracy.  Therefore, I don't need a SMP-II or Unitor.  I have found
schematics for C-Lab's ExPort multi-port expander on the www.  64-channels
of MIDI is all I need.

I will be using C-Lab's ExPort since I have found schematics for it on the
www. It's a very simple and cheap box to make.

Well, I set the modem up on Falcon, ST and TT on Modem1,2, serial 2. I have
set it to 19200, 14400 and lower.

I cannot get it to respond to manual commands with STalker. It will still
auto dial with STalker to various BBSs. But If I type ATDT and a number, I
cannot get anything on the Screen. And no return command messages, very
strange.

It will dial the IP phone # but not connect. Sends back message
"modem returns 14".

It certainly is frustrating me to say the least, since I have 5 other
modems here which I can make work. It almost appears like it is locked up.
Like I said before, I had it connect once with STing, but never was able to
get it to connect since. I thought I had it solved that first time.

Of course you wouldn't need to sync with SMPTE in that situation, though
many friends
have had problems with PT's midi sync, and had to revert to SMPTE.

> Therefore, I don't need a SMP-II or Unitor.

The SMP provides 2 midi ins and 4 midi outs as well, and Unitor2 provides
2/2.
Not only SMPTE. I'm saying the SMP is simply rock solid.
Log3 with Unitor2 gives 5 outs for 6 altogether.

> I have found
> schematics for C-Lab's ExPort multi-port expander on the www. 64-channels

It is my understanding that the timing of Export is not as good as Unitor.
Not sure if would work on the TT.

Which program are you going to use on the TT anyway? Logic or Cubase?

I'm certainly not trying to tell you what to do, but rather trying to
clarify
your intended use.

I do have ST Internals and I poked around a bit with the BIOS routines
but I couldn't detect any input when I should have (my other keyboards did)
so I was thinking that maybe I had to set up an interrupt handler or
something before it would work. But it may well be shoddy programming from
my part, it's been a while :)

>Are you talking zipper noise or timeline accuracy?

I am referring to absolute resolution. Some sequencers do interpolate
MIDI values beyond the 0 to 127 range. But, interpolation is nothing more
then approximation...which I want to avoid.

>Of course you wouldn't need to sync with SMPTE in that situation, though
>many friends
>have had problems with PT's midi sync, and had to revert to SMPTE.

I have yet to run into such problems. With initial tests of my G3
ProTools synching a collegue's MegaSTe running Notator Logic, MTC worked
as expected.

>It is my understanding that the timing of Export is not as good as Unitor.
>Not sure if would work on the TT.

I've been in contact with Emagic and they tell me that ExPort has the
better timing of the two.

>Which program are you going to use on the TT anyway? Logic or Cubase?

On the TT, I will most definitely use Logic. I currently use Logic Audio
Platinum on my G3, so it is an obvious choice.

Newsgroups: comp.sys.atari.st.tech

     Hello, I hope I can get some insight here before I push the panic
```

button.

I use a Syquest 270 removable with my Falcon computer. And it has all my internet files on it, so if I disapear, it will be because of this.

Anyways, here is the problem.

1) Out of the blue it just started to shut itself down. Then it would go from green light to orange light and just keep flicking orange. It didn't sound like the drive mech was moving anymore. Pushing the eject button would fail to eject the disk. It is electronically controlled. The orange light is like the read/write light. So the drive keeps flicking away and I can't get the removable media out.

2) Needless to say after some fiddling, nothing specific, just pushing buttons, resetting, power on, off etc. the drive started to work again. Now of course I didn't remove the media, nope, I wanted to get off some messages and emails first:-). Of course the drive failed once again shortly thereafter.

3) This process would continue on and off for over 3 hours until finally it failed again and it seemed like I was a fool, because it didn't look like I was going to get the removable out, after I had it in and out many times and I have a spare one to test with that has nothing of value on it.

4) Well after about 5 hours of failure, I tried it once again, and by accident I hit the SCSI cable and sure enough, the drive started up again. There may be a problem with this cable. It is not ribbon based.

5) Simply all I want to know is:

A: Could a defective SCSI cable cause the Syquest to shut down.
B: Why does it appear that I have to have the Syquest attached to a working Falcon to eject the disk, when I never needed to do this in the past.
C: I know this sounds strange, but unless the drive is attached to the Falcon, whether the falcon is powered on or off, it will not eject the medium?

Anyways, since I adjust the cables the 10 hours of horrors has passed and the drive appears to be working flawless once again. I haven't shut it off since.

Anyways, this is a good start.
Hope to be able to read the replies:-).

Later Brian.

Hello Brian;

A friend of mine had a problem like this a short time ago and it sounds very similar. So far he has just propped the cable up so it didn't move around and it hasn't skipped a beat since the last time I saw him. It doesn't make any sense why the cable has anything to do with it but it works now and didn't before

Steve

Yes, it's better than just attacking the CPU, but it may not be easier, there is a lot more soldering involved.
>
>Can more details be made available? A circuit diagram?

I think the original article was published in a magazine, therefore it is probably copyrighted. I guess we can talk about it though, perhaps give enough details, so that a person who has Electronics hardware experience can get the ST schematics (which are available on some sites) & draw in the modifications themselves, thus producing their own schematics.

I can start off the discussion. The modified ST needs a new master clock to replace the internal 32 MHz clock. Since the ST master clock is divided down to provide all of the internal clocks, a 48 MHz clock will give a CPU clock of 12 MHz.

You need to cut the trace from the 32 MHz clock & feed in your new 48 MHz clock to the ST's devices. Some devices HAVE to have a particular clock frequency (for example the 6850 ACIA's for MIDI & keyboard, the floppy disk controller & the soundchip). You will need to generate a new 8 MHz clock for the floppy controller, then divide this down to 2 MHz for the soundchip & 500 KHz for the ACIA's.

Lucky for us, the two clock trains do not need to be synchronised.

>Also, what are the consequences?

If you do the modifications, the ST will work 50% faster, but the TV & monitor scan rates will be 50% faster also, they may not work with your displays.

> I suspect that the SM124 might have problems with the 50%
>higher scanning rate (overheating?).

Yes, but I think it can be adjusted to compensate.

> I suppose that one gets a small 640x400 picture in the centre of the screen-
>or is there overscan/lacescan software that can handle this?

You can also adjust the ST to get it back to the correct video rates. This is not that easy, but it can be done in several ways. Essentially, you provide the new video rates from a hardware sequencer, which now controls the Shifter & Glue chips. NOTE, this may only be possible on NON STE machines.

> Also, what with the colour video modes? Would the higher scanning rate make
> them more suitable for a standard VGA monitor.

Unless you modify the ST's basic operation, the basic video modes are the same, ie 320x200/640/200 in colour, 640x400 in mono.

You can program the video sequencer to generate new resolutions, you should be able to get higher resolutions, but not colour VGA..

>What about the DMA port, as it seems that this will be accelerated too?
>Will a SCSI adaptor attached to this bus still work- I got the impression
>that this ACSI port is quite sensitive to cable type and length
>(termination problems, maybe?), and this may get worse at higher frequency.

The ACSI port seems to work, at least the small amount of testing I did seems to work fine. The port runs 50% faster also, so the hard disks are transferring data much quicker. Unless your cables are very good, you might get failures. Hopefully, your SCSI disks are up to the job also.

>Is there anything else that does not work?

Perhaps some games/SW that uses timed loops.

Some hardware addons might not like the new reduced access times (remember the whole bus cycle is reduced by 1/3), so your 4 Meg of SIMM memory should be 70nS or better.

>Thanx in advance;

Have fun, ask more questions, & be careful with soldering your ST.

Ok, this seems straighforward; replace the clock with a 48MHz one. Any particular need fot the new clock to be not "48MHz" but "48.**** MHz" ? (I suspect there is some reason for the "standard" 32.0245MHz, not 32MHz).

By the way, in my particular case it's a Mega ST...

So a little board with 16MHz clock (I need this for the HD floppy I have),
and a divider will do. Or maybe a more elaborate divider to derive
everything from the 48MHz clock.

And then some nicely laid wires to connect to the devices...

Two ACIAs (500KHz), Floppy controller (16/8Mhz), MFP (4MHz), soundchip (2MHz).
I can't see anything else to be fed by special clock frequencies?

>Lucky for us, the two clock trains do not need to be synchronised.

Valuable information.

>If you do the modifications, the ST will work 50% faster, but the TV &

>Yes, but I think it can be adjusted to compensate.

What are the chances here that an unmodified SM124 will work-
and stay undamaged? What exactly happens when one connects it to a modified
computer- does the correct picture appear at all? I would like to use the
same monitor with the standard clock, also.

>> I suppose that one gets a small 640x400 picture in the centre of the screen-
>>or is there overscan/lacescan software that can handle this?

Indeed, can overscan (Lacescan, to be more precise) handle a situation
like this, to obtain a higher resolution (I am primarily interested in
mono picture).

>You can also adjust the ST to get it back to the correct video rates. This is
>not that easy, but it can be done in several ways. Essentially, you provide
>the new video rates from a hardware sequencer, which now controls the

Sounds too complicated for what is to be gained. So the whole project will
be viable only if the video can work unmodified.

My basic idea is to get a modest performance gain for a minimal cost.

>> Also, what with the colour video modes? Would the higher scanning rate make
>> them more suitable for a standard VGA monitor.

>
>Unless you modify the ST's basic operation, the basic video modes are the same, ie 320x200/640/200 in colour, 640x400 in mono.

What I had in mind was that the scanning rate would be higher now, and maybe more acceptable, as there were some warnings here that not all VGA monitors can handle 2x25 fps scanning rate (now it would be 2x37.5 fps).

>The ACSI port seems to work, at least the small amount of testing I did seems to work fine. The port runs 50% faster also, so the hard disks are transferring data much quicker. Unless your cables are very good, you might get failures. Hopefully, your SCSI disks are up to the job also.

So this may emerge as a problem. The disk will probably be OK (a not-too-old 540MB IBM DSAS-3540) , but I don't know about the ACSI cable and the external Ge-Soft SCSI adaptor. The ACSI cable is currently a 10cm piece of flat cable, as the hard disk is sitting right on top of the Mega's box.

>>Is there anything else that does not work?
>
>Perhaps some games/SW that uses timed loops.

Hm, how reliable is the whole contraption? I would not like to do it if it would cause intense overheating or frequent erors. I got the impression that speeding just the CPU to 16MHz works quite reliably, but I am not sure about this 12MHz hack.

>Some hardware addons might not like the new reduced access times (remember the whole bus cycle is reduced by 1/3), so your 4 Meg of SIMM memory should be 70nS or better.

Also a possible problem. In my Mega there are quite a lot of individually soldered RAM chips (for 4MB), and I think they are 150ns ones (will open the box to see).

>Have fun, ask more questions, & be careful with soldering your ST.

Of course, I can't exactly afford to burn a couple of them right now...

Thanx.

Which one is true: B or C, unless something escapes me it can't be both.
If it is B, termination may be the cause.
If termination has gone on the blink in the drive the falcon would probably still
terminate the drive, but won't if shut off.
Unfortunately I can't confirm that as a cause since my (old) drive happily ejects
without the terminators installed (for what it's worth)(and there are newer
versions
with a different electronics card too).

Brian Van TIlborg <madmax@bfree.on.ca> wrote in message news:
%Xm04.147$zb1.1136@198.235.216.4...
| Hello, I hope I can get some insight here before I push the panic
| button.
|
| I use a Syquest 270 removable with my Falcon computer. And it has all
| my internet files on it, so if I disapear, it will be because of this.
|
| Anyways, here is the problem.
|
| 1) Out of the blue it just started to shut itself down. Then it would go
| from green light to orange light and just keep flicking orange. It didn't
| sound like the drive mech was moving anymore. Pushing the eject button
| would fail to eject the disk. It is electronically controlled. The orange
| light is like the read/write light. So the drive keeps flicking away and I
| can't get the removable media out.
|
| 2) Needless to say after some fiddling, nothing specific, just pushing
| buttons, resetting, power on, off etc. the drive started to work again.
| Now of course I didn't remove the media, nope, I wanted to get off some
| messages and emails first:-). Of course the drive failed once again shortly
| thereafter.
|
| 3) This process would continue on and off for over 3 hours until finally it
| failed again and it seemed like I was a fool, because it didn't look like I
| was going to get the removable out, after I had it in and out many times
| and I have a spare one to test with that has nothing of value on it.
|
| 4) Well after about 5 hours of failure, I tried it once again, and by
| accident I hit the SCSI cable and sure enough, the drive started up again.
| There may be a problem with this cable. It is not ribbon based.
|

| 5) Simply all I want to know is:
|
| A: Could a defective SCSI cable cause the Syquest to shut down.
| B: Why does it appear that I have to have the Syquest attached to a working
| Falcon to eject the disk, when I never needed to do this in the past.
| C: I know this sounds strange, but unless the drive is attached to the
| Falcon, whether the falcon is powered on or off, it will not eject the
| medium?
|
| Anyways, since I adjust the cables the 10 hours of horrors has passed and
| the drive appears to be working flawless once again. I haven't shut it off
| since.
|
| Anyways, this is a good start.
| Hope to be able to read the replies:-).
|
|
| Later Brian.

Just badly worded.

It wouldn't eject the disk unless it was attached to the falcon.

It didn't matter however if the Falcon was turned on or if the Falcon was
turned off, to get the disk to eject.

If I disconnected the drive from the Falcon it would not eject the disk.

When the drive powered itself down, I couldn't get it to eject at all.
The orange drive light just kept flashing.

Ok, I follow this clearly.

With bad termination the Falcon can shut the drive down.
Good, this is what I needed to know.

I will assume that the termination went flakey on me.

This is because I don't have a specific termination device on the Syquest.

I never had a problem in over a year.

Thanks for the reply. I know what I am looking for.

Hi Folks..

Anyone ever had problems with a Marpet 4Mb upgrade on an STFM not getting on with TOS2.06..I'm trying to get a customer's FM working with one of Mario's STFM-IDE/TOS upgrades and it's not liking it much. The interfaces all work fine in another machine, and I have done them before to this type of motherboard and not had problems. The main pain (apart from just how tight it all is to squeeze in the 4Mb SIMM board on to0p of the hard-disk) is the fact that it's not repeatable...sometimes it's OK...sometimes it starts, does the bus scan and polls the drives then four bombs....what does four bombs mean?...Is it a bus error or what....Like I say, it works sometimes and not others...I've checked the soldering and it is fine....I'm getting a bit annoyed...if I had another identical motherboard around I'd try putting the RAM upgrade on that and fitting the IDE interface.....

There is a mod you can do to the reset line that reduces noise. What you describe sounds common to problems occuring when accelerator cards are installed in those machines. I have a text file from the SST installation instructions that explains how to install the mod. It's simple. If your address is good, I'll look for the file and send it to you. It is also included in DoitF030 archive under "Georges Harddisk Fix".

This is nonsense. Bad termination never will shut a drive down. As long
as no data are transferred bad termination has no influence on any
device at all.

>
This frequency varies slightly from region to region, I believe it has to do
with the TV scan rates. 32.0245 MHz (the exact frequency can be adjusted
with small trimmer capacitors) divides down to 15.625 KHz, the PAL scan rate.
This is to stop lines on TV screens. This is unimportant if you use a monitor.

I believe you can also use a 40 MHz oscillator, to get a 10 MHz ST.
This is what you do if your ST CPU does not work @ 12 MHz. Most 8 MHz CPU's
work to at least 12 MHz. I was told not to go higher than 48 MHz, as there
would be display problems. I will try 64 MHz sometime, but that may involve
more modifications.

>By the way, in my particular case it's a Mega ST...

mmm, plenty of space for add ons.
>
>So a little board with 16MHz clock (I need this for the HD floppy I have),
>and a divider will do. Or maybe a more elaborate divider to derive
>everything from the 48MHz clock.
>

48 does not divide evenly to 16 MHz, unless you use a lot of extra circuitry.
You do need the 16/8 MHz clocks to have a 50/50 on/off period. If you don't
want the expense of an extra oscillator, I guess you could use the original 32
MHz on board oscillator & divide it down.

>What are the chances here that an unmodified SM124 will work-
>and stay undamaged? What exactly happens when one connects it to a modified
>computer- does the correct picture appear at all? I would like to use the
>same monitor with the standard clock, also.
>
I tried this, only for a very short time. The picture appears on screen, but
is "folded" over itself, so the image is not clear. It looks a bit like what
happens sometimes when a game is in the wrong screen resolution. the screen is
unusable in this way, & it is dangerous to the monitor to run it for a while.

If you adjust the SM124, then it will be wrong if you switch back to a
standard clock. this is one situation where a modern multiscan monitor will
probably work better.

>
>Indeed, can overscan (Lacescan, to be more precise) handle a situation
>like this, to obtain a higher resolution (I am primarily interested in

>mono picture).
>
I guess the Lacescan hardware is relatively hardware independant. I don't know how it would react software wise. Perhaps it will work, if so, the resolution on mono might be as high as 960 x 500. I think you are at the limit of the SM124 here. It's time to get a modern SVGA, but I guess the clarity will not be as good.
>
>Sounds too complicated for what is to be gained. So the whole project will
>be viable only if the video can work unmodified.
>
Unfortunately, the video has to be modified, or else you have to get a multiscan that will cover all the new scan rates. At 12 MHz, the new scan rates for low rez will be 23.43 KHz. It it difficult to get monitors that will sync down that low. For mono, the new rate will be around 47 KHz, with a refresh rate of 106 Hz.

It might be cheaper to modify the video timing & use whatever monitors you have. Unfortunately, I don't have the exact details for the video sequencer, I'll need to figure it out some more.

>My basic idea is to get a modest performance gain for a minimal cost.

I guess that means a new monitor is not in the plans.
>

I don't think it causes too many heating problems. This modification was first performed on the old STM models. The newer models should be more robust, the chips should be able to work better. It's easy to attach heatsinks to the CPU & other devices if you want to keep them cool.
>
>Also a possible problem. In my Mega there are quite a lot of individually

Bad termination won't shut a drive down. What can happen when data is transferred and the device has bad termination?

As it is the syquest is still giving me trouble.

The drive hasn't been shutting down while the computer is running, which it had been doing.

The mech isn't spinning now.
No beep sequence, orange light flashing, won't eject.

Turn Falcon on and

Beep sequence begins, goes to green, will eject if needed.

I am able to use it at the moment.

I was in a used computer store and came across one of these monitors atached to some special Samsung network computer. The monitor is remarkably like the TT HI RES 19 inch monitor. SM 195? Can't remember. This monitor only supports 2 colour black and white.

I would tell you more about the computer its attached to but no one seems to know anything. I will get the model of it, I was in a rush, and can't remember it now. Anyways it is not a DOS box.

IT comes with a special card for PCs to use. Is this the same Monitor that Atari Used? Do I have to change the pinouts to get TT high? If I connected it, would I have a 2 Colour TT at 640*480? I would like to get this and use it in TT high. They also have another 19 inch monitor that does grayscale, but it isn't like this. It really looks like the TT monitor.

Any information would be appreciated.

Also if I connected it to the TT, could I damage the TT or the monitor?

I know I should have more information such as Make model, etc. but that is what happens when you stop into a computer store you have never been in before on a whim, just 15 minutes before you have to get to work, and work is 12 minutes away:-).

Later Brian.

Sounds like something is wrong with the cable. A short circuit for
example. In any case this is not the normal behaviour of a Syquest drive
connected to a Falcon.

Hi all

I'm having great difficulty converting .ST game images into a floppy disk to use with an original ST.

I'm using Makedisk, if the image has the standard 80/9 format the disk is created with no erros but the ST will not boot from the floppy and if you try and load the game from the floppy Icon the disk drive won't read it properly and the game will bomb out while loading.

If the .st image is not a no standard format like 82/9 and I tell makediske to us this format I get sector not founds errors etc all through the creation process. If I force makedisk to use the standard 80/9 format then the disk is created without errors but the ST then sees it as empty.

I've tried formating the floppies using dos switches to force 82 tracks and 9 sectors etc but then I get a drive incompatible error or just incompatible settings and dos stops before the format begins.

I've tried four different PCs with dos 6.22, win95, win98 and win NT
I've tried to read the disks in a Mega ST DS/DD drive, STM SS/DD External Drive, STFM DS/DD Drive and an DS/DD ST compatible drive of unknown make.
I've used DS/DD disks and HD/DD disks all with no success.

What am I doing wrong? I have four STs but very limited software which I'm very bored of, I've downloaded games which I bought and enjoyed years ago but I cannot get them over to the STs, so unless I can figure this out there not going to be much use.

any help would be greatly appreciated.

Hi Mark

What is  tweety board?I've heard the name before
What is it mostly used for

Thanks

It's a rather useless sound expansion board that gives stereo outputs to non-STE machines.

The pages are slowly going up at www.1632systems.co.uk, we now have Jaguar
and Lynx FAQ pages which will be updated, plus helpfiles.

In addition if you follow the links to the Atari Catalogue you will find a
new area in the Lynx Games section called Unboxed Lynx Games with prices
from 3.99 (UK pounds). Stocks are limited, so first come first served. The
address for those who wish to jump striaght away is
http://catalog.zen.co.uk/actinic/1632Systems/16_32_Catalogue_Unboxed_Lynx_Ga
mes_18.html

The second hand used lists should be going up this weekend, networks
allowing.

Please keep me informed of any comments as they are appreciated.

The tweety board is a hardware modification for the Atari ST and MegaST. It creates (correct me if wrong) 3 channel stereo sound. This makes the ST sound chip sound much better, especially through speakers that connect to the tweety boards RCA jacks. IIRC it doesn't handle sampled sound all that well, breaking up the sample in an ugly fashion. Also IIRC it can be turned off if it interferes.

It is an ok, device, not perfect and I don't know of any others that gave the ST stereo sound.

Later Brian.

I need, preferably an ST hard drive, or at least an external floppy.

Until 1993 or so, I used a 1040St with an external floppy and a custom build hard drive. The hard drive died, and then I bought a Pentium.

But I programmed on ST and have a need to update some old software that I created back then.

So, I'm looking for a hard drive for the ST, either an ST hard drive or a custom built one. I'd also need whatever software it would take to get the hard drive working. I doubt that I could find whatever I used back then.

If I can't find a hard drive, I'll consider buying an external floppy. Shortly after my hard drive died, I continued to program using 2 floppies. But now I can't get that old external floppy to work. The light comes on and I can hear a hum, but it won't read any floppies. Might it be reparable, or maybe it just needs a good cleaning?

I've got Gemulator98 installed on my PC but so far I've had no luck in getting my Megamax Laser C to work with, even with the help of the author of Gemulator. The author of Gemulator says he uses Laser C on his PC but for me- it crashes Gemulator. Any advice on this issue?

Even if I can get Laser C working on Gemulator, I'll have another problem- getting my HP4p printer to think it's an ancient HP FX printer. HP sells an FX emulator for the 4p laserjet, but for $200!

Has anyone been able to get a Maxtor 7213S or similar drive to work with the Mega STe internal SCSI host adapter?

I have one that works fine on the Adaptec 2940 adapter in my PC, but not on the Mega STe's internal adapter.

The drive has no terminators, no address jumpers (SCSI ID of 0) and has the "parity disable" jumper installed.

On the Mega STe, the original Seagate ST257N is recognized ok on start-up, but when I swap it with the Maxtor, I get the "Unit 0 not available" message.

The SCSI cable is a standard ribbon cable about 12 inches long.

Thanks for any advice.

This 40MHz variant is interesting, too. It should give 25% performance
increase, but with (I hope) less problems with video, memory-chip
speed, etc. If it will work with Lacescan (I have it installed already),
it should be just enough for a 800x600 monochrome display, which I am
sure some programs, like Megapaint will like (Megapaint does not like
my present overscanned 672x472 resolution).

>>Or maybe a more elaborate divider to derive everything from the 48MHz clock.
>48 does not divide evenly to 16 MHz, unless you use a lot of extra circuitry.

Ah, that's true, I did not think too good.

>>What are the chances here that an unmodified SM124 will work-
>>and stay undamaged? What exactly happens when one connects it to a modified
>>computer- does the correct picture appear at all? I would like to use the
>>same monitor with the standard clock, also.
>>
>I tried this, only for a very short time. The picture appears on screen, but
>is "folded" over itself, so the image is not clear.

This "folded over" picture sounds like the effects one get with overscan
circuitry- maybe the software setup for overscan, which can shift the
picture within the time-frame of a scanline can correct this. Then remains
only the overheating problem.

With 40Mhz clock refresh rate would be about 88Hz, hopefully SM124 can
handle this? And what about the colour mode- I use the RGB inputs (SCART)
on a Sony TV when occasionally I need colour; with the new circuitry the
refresh would be slightly above 60Hz. Is there a possibility that Sony can

handle this- I got the impression tht they can all go at least to 60Hz refresh (2x30Hz interlaced), because of American users.

Anyway, the general idea, If I try this, is to make the clock switchable, so that I can revert to original 32MHz.

Hi Group,
     Just got a Mega4 st computer from a friend.  It has no hard drive
or modem or CD rom.  I have an old NEC 3d Multisync monitor that I waNT
to hook up to it, but I have no cable ( omniswitch.)  I don't want TWO
monitors on my desk, if just the ONE Nec will do the trick.
     What is the best equipment, ( size, brand, speed,etc.) I can get
for this Mega4 ST ??

                              Thanks.....
                                 Mike
```

I have a falcon connected to a one year old Smile 15" VGA monitor.
For some weeks now the 'red' is missing, most of the time, but not always.
This gave me the impression that the Red signal is missing somewhere,
so I changed the VGA adaptor for another one, to no avail.
Today I checked the falcons PCB and the 15pin DB connector, but
everything seems to be ok. Since the falcon is my only computer
I'm unable to check whether it is the monitor or the Falcon that
needs repair. Now what can I do to check this out? I have a scope,
but what does a correct 'red' signal look like?

Regards,
Guido

DOITF030 HTML V 6.6.8   Hardware Tip & Tricks Atari Falcon F030

Sie werden in DOITF030 alle Kabel- und Schnittstellenbelegungen

neben den Custom Chips und ihrer Beschreibung finden. Auch viele Bau- und Umbauanleitungen zum Atari Falcon F030. Insidertips und komplette Reparaturanleitungen runden das Angebot ganz sicher ab. Highlight dieses Archives sind umfangreiche Reparaturanleitungen f�r fast alle Subsysteme inkl. einer genauen Bauteilebeschreibung. Neben Tips zum Massenspeicheranschlu�, der Ramerweiterungen und dem Einbau diverser Beschleuniger, finden Sie hier auch sehr ausf�hrliche Umbauanleitungen der letzten originalen Atari Maschine in andere Geh�use. Video-, SCSI- und IDE-Adapter in genauer Beschreibung sind ebenfalls vorhanden.

DOIT_ST_ HTML V 2.7.5 Hardware Tips & Trick Atari ST Serie

DOIT_ST enth�lt Tips & Tricks rund um die Hardware der ST-, TT- Mega-Serie. Pinbelegungen der meisten Customchips, komplette Beschreibungen einzelner Systemteile, Reparaturanleitungen und Bauanleitungen f�r Zusatzhardware. Das Archiv ist keine Abwandlung oder eine Fotokopie der technischen Dokumentation von Atari.
DOIT_ST ist vom Anwender f�r Anwender.

DOITMAC_ HTML V 1.5.1 Tips & Tricks zum PowerMac

Sie werden in DOIT_MAC viele Kabel- und Schnittstellenbelegungen neben ihrer genauen Beschreibung finden. Ebenso viele Tips & Tricks sowie kleinere Umbauanleitungen zum Apple PowerMac oder PowerBook. Speichererweitung, wo mu� was rein, Batterien, Netzwerk, USB, Adapter komplette Beschreibung der Monitoradapter, Systemsoftware uvm. Allgemeine Daten und Insidertips runden das Angebot ganz sicher ab. DOIT-Mac ist f�r Ein- und Umsteiger, aber auch f�r Fortgeschrittene die das ein oder andere Problem haben.

DOITSOFT_ HTML V 1.6 Informationen �ber Atari Software CD-ROMs

Eine Zusammenstellung und Zusammenfassung von Informationen und Inhalte verschiedener CD-ROMs mit Atari Software. Sicher l�ngst nicht alle, das liegt aber an Euch. Ich kann und will nicht alles kaufen.

PROFIJAG_ HTML V 2.7 Tips & Tricks zur Atari Jaguar 64 Bit Hardware

Sie werden in PROFIJAG alle Kabel- und Schnittstellenbelegungen sowie auch Teilweise die Originalschaltung neben den Custom Chips und ihrer Beschreibung finden. Bau- und Umbauanleitungen zum Atari 64-Bit JAGUAR. Insidertips, komplette Reparaturanleitungen f�r alle Systemteile der Konsole, farbig bebilderte Beschreibungen aller m�glichen Videoanschlu�kabel z�hlen zu den Highlights dieses Archivs.

DOITLYNX_ HTML V 1.7 Die Reparaturanleitung zum Atari LYNX Handheld

DOITLYNX enth�lt neben den Pinbelegungen aller Schnittstellen auch
die vollst�ndige Pinbelegungen der Custom Chips, des Modulports und des
LCD-Displays. Von allen Baugruppen sollte sich so eine Beschreibung
finden lassen. Komplette Reparaturanleitungen f�r Video, Sound und
Stromversorgungsteil empfand ich bei der Herstellung des Archives als
Pflicht.

DOITSPEED_ HTML V 1.5 Atari, Mac ISDN und der Hagenuk SpeedDragon

AT-Kommandos, kurze Beschreibungen der wichtigsten Dinge.
Inbetriebnahme und wie man es vermeidet lange Sinnlos zu suchen.
DOITSPEED ist eine Kurzanleitung zum Speed Dragon, enth�lt Tips
zum Betrieb und Anschlu� f�r Atari und Macintosh. Informationen
zur Steuersoftware f�r Atari und Mac.

DOITDRIVE_ HTML V 1.4 Allgemeines zum Festplattenanschu�

Allgemeines zum einfacheren Handling von IDE und SCSI Festplatten.
Nicht Plattform abh�nging geschrieben. Enth�lt Jumperbeschreibungen,
einfache Richtlinien, alles zu Terminierung und diverse Tips aus
Benutzersicht.

Try twisting monitor's cable at both ends.
If red component returns/dissapears while diong that, you have found
your source of trouble-cable.
I have encountered that many times. Cables usually break at the computer
end or near ferrite rod on the cable, if there is one.

Regards,

Branko

Try another monitor, make sure that isn�t a problem of the falcon.

Check monitor wire, both end�s if you can.

> This gave me the impression that the Red signal is missing somewhere,
> so I changed the VGA adaptor for another one, to no avail.
> Today I checked the falcons PCB and the 15pin DB connector, but

Otherway, check monitor on any other computer.
I think that�s more a problem of the monitor.

Never hear anytime that the falcon only lost one color.
Mo informations about falcon video -> DOITF030

> needs repair. Now what can I do to check this out? I have a scope,
> but what does a correct 'red' signal look like?

Can�t display waveforms here.
Connect falcon via RF lead to an TV, check colors.

Regards, Robert

Is there an extender available for the monitor connector on a MegaST?
I want to put the CPU and [more importantly due to its noise) a
Megafile in another room and just the monitor and keyboard/mouse in my
studio. I found that I can use a phone extension on the keyboard. Now
I just need an extension for the monitor.

What can I use?

Demzy

I don�t know how you can get an extension lead for 13 pin atari, some dealers have some if atari was "brand new". These days i can�t only say "self made"

Needs 13 pin atari mal DIN plug, 14 pin shieldet cable, 13 pin female Atari plug. All wires connectet 1:1. Male 13 pin connectors can be found at conrad electronics (www.conrad.de) but i�m not shure female plugs too..

Ask Brad Koda from best electronics for lead/ or both plugs.

Last but not least, all cables longer as 2 meter can, but not must work! You got interferences with long monitor cable. Signals are not amplified. Same with keyboard.

Regards, Robert

Hi to all,

I have finished schematics for expansion card for Atari ST, which I intend to publish on the Web (schematics, PCB files etc.) with the exception of the small key IC which would be available at a small fee (I was thinking of something around 30 DM or so).

Technical data is:

-16 Mb SIMM, out of which 14 are used. lowest 4 Mb are used as an read shadow of original ST RAM. This also means that ST must be expanded to 4Mb, but that should not be a problem nowadays... Upper 2 Mbytes are currently unused, but they could be neatly used to shadow RAM on the ET4000 VGA card. This could speed up communication with ET4000 substantially. Unfortunately, I don't have any data on ET4000 nor MEGA4000 interface, which I need in order to implement this...
Of total RAM only lower 4M can be used in traditional way (DMA ops., screen memory etc.) and upper 10 Mb are accesible from CPU's side only. I was told that this was not a serious restriction. I was hoping that I could use uppermost 2 Mb as a shadow RAM for ET4000 frame buffer, but I need more data for that...

- FPU socket for 68881 or 68882. Only PGA socket is supported, since I don't have pinout for PLCC version. If anyone has PLCC pinout, please email it to me.

- sockets for four fast FLASH memories 29F010A from AMD (128 K x 8-45 ns acces time). This means up to 1/2 Mb total can be on the card. Tos switching is not supported, so one can't use old TOS's with the card as this would made things too complicate and seems unnecessary at this point.

- at present card does not support blitter. Since CPU will work on 32MHz (and hopefully on 64 MHz :-) blitter would slow the animation, so it does not seem as a serious limitation. Trouble is in the fact that since card is shadowing the main 4 Mb RAM, it would have to make changes in it's shadow memory every time when blitter writes anything in the ST's 4 Mb...
Things are further complicated by the fact that blitter can write anything anywhere and not only in low 4Mb RAM...
If I find suitable solution, I will implement this. DMA channel should be snooped, though. This means that every DMA write to main 4Mb will be copied to card's memory in order to keep shadow RAM consistent with main memory.

- write latch for latching any write cycle to the rest of ST's circuitry or main 4 Mb RAM residing on ST (could be neatly used for ET4000 as well, if I get the needed data) This means that when CPU on card is writing data to slow external devices. write latch takes over the data and frees CPU for next instruction. Special circutry then takes care for latched data and performs a write cycle.

- dual IDE port, each capable of fastest PIO transfers and each with second onnector for small 2.5" drive. I have realised the second channel hardware and expect from others to write suitable drivers for ST...
-Inside key IC (PIC12C508) there should be enough space for RTC and maybe for a few bytes of nonvolatile memory, if anyone finds use for this...

-card should behave on the 68000 bus inside ST pretty much like any ordinary 68000. This means that one can increase ST's frequencu with 48 MHz or higher, This would off course enable higher resolutions and faste data transfer between card and the res of the machine. CPU inside the card off course works on it's own clock, but the circuitry responsible for bus operatins on old 68000 bus will transfer data faster...

I did not went into troubles with implementing some kind of Overscan or other graphic improvements, since these would made things too complicate. I think it's best to leave them for possible further enhancements. Objective of this card was to succede old IDE cards with TOS 2.06 with higher CPU speed, better IDE expansion, FPU and more RAM. RTC is just side-effect of key IC.

But OTOH, implementing enhanced ET4000 interface would not ask for many additional components, as practically everything needed is on the card already. Also I did not want to bother with Coldfire instead of good old 68000, even though it should be some 5x faster (MCF5102), as this would complicate things much more and there are many other bottlenecks that would limit resulting speed.

If anyone has a neat idea of something interesting that could be implemented without too much bother, it would be welcome.

As said in subject line, I would be very grateful for additional info on ET4000 and MEGA4000 (registers, addresses, ISA connection etc.). I have tried to contact Torsten Lang about this through several email addresses, but have not succeded.

It would be nice to know more about signalling between ST's chips during DMA transfer (communication between GLUE, DMA and MMU), but even if I don't receive any help on this I can get through this one by myself...

Best regards to all,

Branko

Check out the quick FAQ. You'll want a SCSI adapter and a SCSI external
drive, or an internal IDE adapter with an IDE drive.

> or modem

Any PC modem will do, but speed is limited to 19200 bps.

> or CD rom.

You would need a SCSI adapter for this, but you can get away without a
CD-ROM on an Atari. It's not very useful unless you have a lot of CDs to
read. In this case, go the SCSI route.

> I have an old NEC 3d Multisync monitor that I waNT

The cable is one of those used for telephones, but I'm not sure if it's
cabled correctly. Chances are that a pin to pin extension cable will
work.

Unless you live under the tropics, you can also probably get away with
just disconnecting the fan. There's no reason a Mega ST should need one
if the STF or STE didn't.

Today I checked the Smile ant the circuit board on the CRT, and there's
no way to repair this board. All connectors were fixed very tight, by
melting the plastic a little, and all was very heavily shielded. So I quess
this isn't the problem either.
The story continious. As does my rather 'spooky' screen.

Robert wrote:

Good advice! But, unfortunately my TV set went broke yesterday.
This is a conspiracy!

I have small quantities of the following Atari ST & TT monitors for sale.
All units have been cleaned and detailed, and in good or better

condition, but without boxes unless noted. These units were from a local Atari software developer who has now cleaned out their stored Atari items, so all are in great shape. If you have any questions in regards to unit condition, please feel free to ask.

All offers should be made in U.S. funds with the buyer paying shipping. I am also willing to trade for certain items, please see my
list at the end of this post.

If you are interested in any of these items, please respond to Jim at classic.games@NOSPAM.telusplanet.net (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800, Colecovision, Intellivision, Classic Computer, Vectrex or Handheld games) sent to you, please specify system.

Hardware Please make an offer
==
- Atari SC1224 Monitors 13" ST Color Monitor
- Atari PCT1426 Monitors 14" High Resolution TT/PC Color Monitor
- Viking 1280 x 960 20" Monochrome TT Monitors - In original boxes

Trades
==
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar and Jaguar CD Unit
- A working Vectrex controller
- A working DSS Satellite Receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

I'm not able to help from a technical point of view, but this is a
very interesting project, and I personally know at least one STe user
(it will work on an STe won't it?) that would be interested :-)

Keep us posted...

Bob,

I had a Maxtor that I had the same problem with and can't remember _exactly_ why it won't work, I seem to remember it was a power issue.

I brought in external power to the drive and it worked fine. Of course that was a messy arrangement so I bit the bullet and mounted the drive in an external case with the ICD Link SCSI adapter.

The drive and similar Maxtor drives work with the Atari - they just don't like to be mounted internally.

I took down to Cash Converters once 3 Amiga 600s, 1 1200, a Shit load of oroginal software including top of the range Genlock software plus a Genlock andthey basically told me to throw it in the bin which I did. 150 bucks for an ST!!. Just get one of the emulators if you really want to play with an ST.

I only listed the numbers provided by the HDUtils programme. If they are
not correct........

Anyway, I have fe-formatted the SyJet using SCSI Tools (from my old ICD
Pro disks) and a sector check by HDUtils does not find any bad sectors. I
just hope that this is the end of my problems.

>U use scart?

Yes I do on the CM8852 colour monitor. I don't think it can be an
impedance problem, as an imbalance would normally just produce an

unclear display (echoes, or weak video signal etc), rather than no signal at all on the mono monitor. In any case, impedance problems would surely affect the STFM's output (which works) equally to the Falcon's (which doesn't). And plugging the SM124 lead in directly works fine, whereas the switch *always* feeds only the colour monitor from the Falcon with the SM124 screen remaining black. I do, or course, use a different plug adaptor on the Falcon for VGA and the 13-pin ST-type lead.

Naturally I knew that - that's why I said 'of course' in my post.

>> When I connect it to the RGB adaptor on my Falcon, however, the signal

>
>That's because the only signal coming out of the RGB is a colour one
>!! There is no power requirement that is not being met as far as I
>undderstand.

But in that case why does the mono monitor work when plugged in directly but not via the switch? And re the powering, *something* has to supply power to the switch chip - either the computer or one of the monitors it is connected to, and since the monitors haven't changed I assume it is the STFM.

Since writing the original posting, I have done some further research: Judging from the pinout in 'The Atari A to Z', The ST series supplies +12V DC pullup power for Peritel (SCART) devices on pin 8, while the Falcon's is on pin 17. I wonder whether this is what powers the switching chip, and whether the 'Atari'-branded adaptor plug possibly omits this cross-connection? Unfortunately it is a moulded assembly which can't be opened up without destroying it AFAICS!

>The mono monitor is sharper - it's high resolution compared to the
>colour output - which is either low (for most games) or medium resolution.

I think another difference is that a mono monitor doesn't have a shadow mask, so the picture is continuous and not broken up into dots, which makes it look sharper. It also works at a higher frame rate = less flicker (though I am not sure at what frame rate the SVGA monitor is working at when switched to ST High resolution - I suspect the same 72 Hz). I have also recently been given an old IBM PS/2 mono monitor, which works fine in greyscale on the Falcon; not quite as sharp as the SM124, but it *is* rather knackered :-(MUCH easier to carry about though! :-)

>Doesn't your SVGA handle the games / demos ??

Not all of them - some require RGB, others work fine.

Regards, /Peter/

Thanks Steve! As you may have seen in an earlier reply, I came to a

similar conclusion - I suspect that the adaptor isn't wired for it. No
great loss, since I don't think I'll use the switchbox with the Falcon.

Having looked at my Gasteiner HD docs, it appears that their software,
at least, allows for *DMA* addresses 0 to 7, rather than SCSI. If the
drives are connected with standard SCSI plugs, you could just try
extending one of the leads, and use different software.

Hello there.

I was wondering where i could find more info and/or tools about the Spectre
floppy format used in Dave Small's Mac plus emulator. I need to transfer
such floppy disks to a Mac SCSI HD.
Every answer for Atari/Mac/PC is welcome.

Thanks , Yves.

I didn't say that the number was incorrect. It's just a number not
covered by the SCSI standard.

So you were able to achieve this with a single format run or did you
have to format a second time with providing a bad sector list?

I want to hook up my Mega STe, TT and Falcon via the LAN ports. I will be using STing, and IP masquerading. What I need to know is how do you connect 3 computers together with this hardware layout. Is there some other In/out device I require? Actually, I will have a few STs together via the midi ports as well, but I know how this is done.

Any help appreciated.

Later Brian.

SCSI Tools did not report any bad sectors after a single format run, so I
used HDUtils to do a sector check as I was surprised that no faults with
the medium had been reported with SCSI Tools ;-)
I have yet to physically check the cart by filling it up and trying to copy
the files back off again, but I will probably try this at the weekend.

As a replacement unit inside a SF314 or SF354, yes. You need to perform
the same changes as for an STF/STE internal drive though (maybe you can
get away with the ID number change).

Check out the Quick FAQ.

Hi Steve,

I keep meaning to visit Chesunt, but due to personal reaasons and illness
in last 18 months I haven't been able too. Contact me I would love to see
the beast and visit

Nick

Yes, this is surprising, indeed. since both tools don't do anything
different when formatting a drive. The drive does everything on its own.
Anyway, it's fine that your problem seems to be solved.

I'd like to build a monitor extension for my ST to the SM124 (the
monochrome monitor) but I don't know:

(a) what type of cable to use or
(b) what the connectors are called.

Is a 20 foot connector feasible? I've done it with an SVGA connector
on my PC and, despite some degradation of signal, it works.

Anyone?

20 foot is what ? 6 meters ?

Why would you want to do that anyway ??? If it's because of the fan noise, just disconnect it. It's useless on a standard MegaST. STF's have more or less the same hardware, and no fan.

The connectors are called 'Atari 13pin DIN'. You can find them in the Conrad Electronics catalog (in germany or France). Best Electronics in the US has them, and I beleive so do Maplins in the UK. Any 13 wire cable should do, but I guess shielded would be better for that distance.

Hello!

Can anyone help me.
I have used an old STe for transfering data from my Portfolio, and everything has worked exellent.
Now I want to give my STe away to a person who can use it to something better than just transfering data.
I then tried an old STFM for the same purpose. But it will not work!

I use:
Portlink.prg
Parallel interface for the Portfolio
A home made cable with a LED etc.

The trouble is that Portlink.prg stops with a glimpsing file selector box!

Anyone who can help me solve the problem?

The SM124 comes with a 13-pin DIN connector - yoou just plug it in.

> Is a 20 foot connector feasible? I've done it with an SVGA connector
> on my PC and, despite some degradation of signal, it works.

Yes, I think this should work. The signals are at relatively low frequency and high strength.

Why are you asking about cable and connectors? Does your SM124 not have a video cable?

Roger

I have both a hayes 288 accura v34 fax modem and a Supra 28800 faxmodem.

STing works with the supra and not the hayes.

The hayes does not acknowledge anything I put in the initialization string for STing. Be it ATZ or AT&F2. STing will show the command when trying to initialize the connection, and thats it. I have also put carrige returns after these statements. The supra works fine.

I have once gotten this modem to work with STing, but was unable to have it reconnect after disconnecting. Back to the same problem.

I tried it with STalker and it will work with AutoDial. However it will not work if I type a number in or simply give AT commands and await the OK reply. I have check the autodialer configuration and there is nothing different from my manual settings.

I hook up the supra and sure enough I can type in the AT commands and the modem replies.

What is up between these two? I just want to get this Hayes working with STing in one fashion or another.

Later Brian.

All help appreciated in advance.

Hi

I'll be interested in this one, as I can't transfer files to my Mega STE/STE's. Everything works OK on the PC side, but my parallel port is tied up.

Come to think of it, I've never tried it on an STFM.... I might give it a go, at least I'm fortunate to have several ST's knocking around!!

I'd love to get my card drive to work with an Atari as well, as I have to have it on my other pc that is networked (no space or free ISA in my main pc) and that has gone down on me:((, has anyone worked a way to do it!

```

To answer questions of "why" I want this info:

- this is an extension to the existing monitor connector
- I have a very, very noisy fan on a MegaFile 60 and want it out of the room
- the MegaFile 60 will be daisy chained to my existing FaST 30MB HD, adding to the already unbearable noise
- I will use it in a home recording studio (so I need a keyboard extension as well, for which a phone jack extension seems to work)

Hope these questions are clear! Anyway.......

1) I have a 520ST with 30 pin SIMMS, are these normal PC 30pin SIMMS?, as I also have an ST1040, the only difference between this and the 520 is that it doesn't have any audio phono plugs on the back, will this also be using SIMMS as its memory as well?, and can this be upgraded with PC 30pin SIMMS?

2) If this is the case, and I put say, 4mb of memory, is it possible to create a Ramdisk with GEM?

Regards,
Greg

That's very good, at a very reasonable price.
When you decide to publish this board, let us know!

I have a home address of Torsten Lang. I don't know if it's still
valid, but you can try with a letter.

I assume you have a 520STe and a 1040STf? The STe series of Atari computers
uses 30 pin simm. The ST/f series requires a daughter board. There are
such boards available for the 1040ST that use Simms.

>2) If this is the case, and I put say, 4mb of memory, is it possible to

You can create a ram disk with a 520K ST let alone the 1040ST.

I suggest you go to.

http://www.umich.edu/~archive/atari

this is just to show you the listing of software for the ST.

then select Utilities

and you will find MANY ram disks which you can try.

I need to know what you have in the STing initialization box.

Such as

ATZ

I am curious to know if the Hayes uses a different command set.

I would like to send it reset commands.

I would like it to respond to my manual commands.

Thanks Bob.

Well i'd recommend MiNT-net for that but that may be just me...
(wait, can it do NAT these days? if not you'd need something
else on the NAT box, but only on that one of course.)

> What I need to know is how do you
>connect 3 computers together with this hardware layout.

The `LAN ports' are just regular serial ports only with different
electrical characteristics, they're not faster or anything like
that... (at least electritcally its the same thing macs used for
their early slow way of networking called `appletalk', but to use
them like that you'd need special drivers which may still not
exist.)

Anyway i'd just use null modem cables, connect the `normal'
serial ports (which go to the same uart chip) and set up 115200 bps
slip links with header compression. (or ppp, but slip has less
overhead and for fixed links ppp's features are of no use.)
Actually I believe the TT's ports can do 230400 too but i'm not
sure about the other machines... and use modem2 and/or serial2,
modem1 is on a different uart that can only do 19200 bps. Make

the fastest machine the router (and NAT box, i.e. the TT), meaning you'll have one slip link from the TT to the Mega STe and one from the TT to the Falcon. Actually since these are all ataris you could also use plip (parallel port ip) for one of the links, thats a bit faster than serial...

And btw 115200 bps slip is also what i used years ago to link my Mega STe to the unix (BSD) box and it had no problems getting some 10K/sec throughput with ftp. (well ok, that was with a hardware fix, see below...) It even for a while did uucp-i over tcp to my `ISP' over that link after i switched from analog to isdn (with the BSD box routing the packets to isdn, single channel sync raw-ip) and that little 68000 then exchanged my mail and news with nearly isdn speed (sending and receiving at the same time) and still had CPU cycles free.

The hardware fix: On the Mega STe atari screwed up (at least on mine, but others reported similar problems): With the original SCC chip (thats the uart that controls the faster serial ports) serial IO on those ports could interfere with disk DMA(!), which had me searching for a long time for mysterious data corruption even though the protocol on the serial link discovered _no_ CRC errors. (anyone who still knows what protocol i was porting back then gets a virtual cookie!) When i finally replaced the SCC with a better pin-compatible Zilog one the problem went away... (Don't remember the part number anymore but this chip was also mentioned in the hsmodem docs, i didn't change its clock tho.) It also has 8 bytes FIFO on each channel, the original one only had 3, so if you get `silo overflows' at the higher speeds (receiver overrun, would cause tcp/ip to have to resend packets) that would be a way to fix those too. Actually as i remember on the TT the SCC also had DMA channels but i have never heared of them actually being used... (that would be another way to get rid of receiver overruns, and it would lower the CPU load too. But of course receiver overruns are more likely to occur on the machines with the slower CPUs, where you don't have the luxury of DMA on the SCC.)

> Is there some other
>In/out device I require? Actually, I will have a few STs together via the
>midi ports as well, but I know how this is done.
>

I'd like to see the finished setup, sounds like a nice computer museum... :) (or, would you give me a ssh login? if you want i could probably compile you stuff on the cross compiler...)

>   Any help appreciated.

Yves

I still have my ST running SPectre and a Mac side by side. Can't remember, though, is the format you talk about readable for the ST under GEMDOS? Or is it readable only when Spectre is running?

In any case I found the most reliable way to transfer files using a null-modem cable and STalker on the ST and ZTERM on the Mac. The Mac emulation can also run ZTERM.

If you can be a little more specific (about how the disks were formatted) I might be able to reproduce your problem.

Peter

Can anyone in the group give me details about how to use a regular television with a MEGA/STE? I have three ST monitors which don't work (two SM 124s and an SC 1224). I bought an RF modulator from Radio Shack and tried to interface but I'm still not getting the ST screen on the TV. Perhaps someone will also know if there is any help online for ST users.

Thanks for any help,

Al.

Hello Peter!

Thanks for answering my request ! :)
To be more precise, Spectre disks are formatted under the emulator but it's possible to copy them with any serious ST disk copier (such as Procopy, Acopy...) ... I don't know precisely how these disks are formatted, but it seems that the emulator doesn't use the cartridge hardware (except the roms :))   when it needs to read/write such disks.
It's not possible to read spectre disks contents under gemdos : erroneous free space info, unreadable data (0 objects...).
I think this disks are a kind of "image" of original Mac GCR converted in MFM format.

My will is to be able to extract mac files from spectre disks without using spectre, and particularly to do it with a PC.

But I don't know where to get more info, or to ask the most famous Dave Small about this. ;)

Thanks again,
Yves.

I am interested in using an Atari TT030 for MIDI MTC'ed to my Macintosh G3 ProTools Mix system to avoid using OMS. Therefore, I have the following questions regarding compatibility, expandibility and networkability of the TT:

Does Cubase or Notator (original or Logic) work with the TT?
Would they run in ST or TT mode (if there is such a thing)?
Would they use TT or ST RAM?
What is the maximum TT RAM expansion?
What is the maximum ST RAM expansion?
What kind of SIMMs (if at all) does the TT use?
Does C-Lab's Unitor2/ExPort MIDI expansion interface work with the TT?
Does Steinberg's MIDIEx work with the TT?
Is the TT networkable to a Macintosh G3? How is this accomplished? What protocal is used?
What is the theoretical transfer rate (mbits/sec) of TT <-> Mac networking?
When networked, is there a way for the TT to access my Mac G3's adsl connection?
What is the largest capacity harddrive that the TT can have internally?
How many SCSI devices can the TT SCSI controller access?
What solutions are there for accessing multiple SCSI devices on the TT?
Is the TT easy to rackmount? In other words, is the motherboard small

enough to mount in a standard rackmount case?
Is the TT easily moved into a PC-style case?

Thanks in advance.

Hi!
I have a problem with the atari-port of gcc. The compiler runs
correctly, if my code is not preprocessed (I get only a message of
unknown # commands, but that is ok). But if I try to compile
preprocessed code, I get the nasty atari-bombs (the compiler chrashes).
I tried also g++ with the same effect.

Thanks,
Matze

If I recall correctly, it seems there was a utility with the Spectre
disk allowing conversion from Spectre to Atari. I recall using the
procedure to produce Postscript files under Pagemaker and then
converting them to Atari format for printout with Ultrascript on the SLM
laser printer.

Forget about Dave Small. He occasionally pops up on AtariCentral to drop
in a message, and equally quickly disappears. He won't even answer an
email. He listed his web site, but I deleted the bookmark since he
doesn't respond, and is no longer involved with atari.

Ok. I use Logic Audio with PT sometimes.

>> Would they run in ST or TT mode (if there is such a thing)?
>Cubase and Logic run in TT-medium using VGA or TT-high using Atari monitor

TT highres is why I am interested in the TT in the first place!

When I was using a Mega4STe for MIDI (many years ago), I would easily run
out of memory running Notator Logic.

>> What is the maximum ST RAM expansion?
>4meg and 3rd party cards (i think)
>
>> What kind of SIMMs (if at all) does the TT use?

>CBX

Falcon? I never mentioned the Falcon. I will be sending out MTC (MIDI
Time-code) via my Digidesign SMPTE Slave Driver to synch the TT with my G3
Mac running ProTools.

All I want the TT to do is MIDI. That's all! I'm sick of the sluggishness that OMS in ProTools provides. And I'm also sick of the horrible automation that Logic Audio provides.

>> Is the TT networkable to a Macintosh G3? How is this accomplished? What

Since I have no floppy drive in my B&W G3, I need a way to transfer files to the TT, in case my above question regarding the networkability between Mac <-> TT didn't work.

>> What is the largest capacity harddrive that the TT can have internally?
>ask Uwe Seimet for the correct answer

4GB? That is all I need for MIDI files.

>> How many SCSI devices can the TT SCSI controller access?
>8 i think

8? Maybe I should ask Uwe Seimet.

>> What solutions are there for accessing multiple SCSI devices on the TT?

I am not talking about taking the TT and sticking it on some rackmount shelf. I am talking about physically removing the electronics from within the TT and rackmounting these (motherboard, I/O ports, PS, etc...) in a rackmount case. Has this been done?

>> Is the TT easily moved into a PC-style case?
>dont waste your money, just put a front-panel power switch on it

PC style cases are cheap. My G3 is in a rackmount already. I have no problem with funds.

>> Thanks in advance.
>hope this helps

It has a bit. But, I still have unanswered questions.
Steven

Could anyone in here tell me what the load_img.SLB does, if i set my magx.inf file to load
it my machine crashes at boot, but my system never whinges for it.

So what does it provide?,
what uses it?

Regards from STEve & his nice warm cosey PAK'd   MegaSTE .

Can you see the email with NEWsie? Does the Get selected mail function show you the email available. Are you using another program with NEWsie such as Popwatch? What error codes do you receive from NEWsie?

Turn your log file option on if it is turned off. Log on with NEWsie, try to get your mail. Quit NEWsie and read your NEWsie log file. See what error codes or messages your mailserver sends you.

This should be a start.

Later Brian.

So far, I am getting a few different error messages.
#3
#22
#28

I also get modem sends NO OK.

I also have managed to leave the initialization string empty.

I lower the modem speed on the TT to 38400 on Serial II (I have it maxed out with the supra and same setup), and sure enough I see the modem lights dialing.

I hear the modem attempt to connect with the ISP but it is never successful in establishing a connection.

I booted up stalker and use the supra just fine in the command line.

Type AT and get a response. Type M1 and get the sound.

When I connect the Hayes, I cannot use the command line of Stalker.

If I type a key, NOTHING happens on the screen. If I type AT, I cannot see the AT command on the screen.

All I have done is changed modems. However like I said before, the AUTODIALING of STALKER allows the HAYES MODEM to work.

So I repeat problems again.

Hayes modem does not react to initialization string.
It will not go to next line following initialization, such as DIALING the # when there is an initialization string present.

ini= atz or atz or atf1m2 etc.

dial=atdt 758-2000 or 758-2000

The initialization string appears in the STing window and does not advance to the dialer.

Everything I test works on the Supra and not the Hayes.

I would like to try to reset the HAYES to factory settings, however if it won't recognize the command string from a terminal prg. I don't know how to accomplish this.

I do know the modem works. I have dialed a longdistance BBS unknowingly while testing it:-). I have heard it attempt to connect to the ISP only to fail to connect. It returns the message, no modem connection is phone number correct.

Again, anyhelp would be appreciated. I don't really need to use this modem, but I just never sleep well at night, knowing I have something I can't get to work properly.

later Brian.

8 megs, but there are some 3rd party cards that go to 32M and beyond
you dont need to expand a 4-meg machine to run Cubase

> What is the maximum ST RAM expansion?
4meg and 3rd party cards (i think)

> What kind of SIMMs (if at all) does the TT use?
i dont know
dont waste your money on the TT, just get it up to 4 megs

> Does C-Lab's Unitor2/ExPort MIDI expansion interface work with the TT?
not with Cubase, and not with Notator, since notator wont run on a TT at all

Unitor2 works great with Logic

> Does Steinberg's MIDIEx work with the TT?

yes, with Cubase, and so does the SMP-24/II
not with Logic

I run both Midex+ and SMP-II
Dont think about syncing Cubase CBX/Audio Falcon to SMPTE with Midex+, it will crash
you must use SMP-24/II to sync Cubase CBX/Audio Falcon when using audio tracks
note that you can run Cubase Audio Falcon on any Atari in midi-only mode,
so if you dont have Cubase yet, look for Cubase Audio Falcon or Cubase Audio CBX

Actually, Atari released a 8Mb ST-RAM card. The TT has only 2Mb TT RAM unless it's expanded.

>> What kind of SIMMs (if at all) does the TT use?
> i dont know
> dont waste your money on the TT, just get it up to 4 megs

It's possible that you can use 30-pin SIMMs (1Mb and 4Mb) on some original TT-RAM card. The ones I've seen use SIPs though. Aixit's TT-RAM (aixTT) use standard (and now very expensive) 72-pin SIMMs.

>> What is the largest capacity harddrive that the TT can have internally?
> ask Uwe Seimet for the correct answer

Given the correct driver (i.e. a late version of HD-Driver) I don't think there are any limits. You'll probably need MiNT or MagiC to use the really big ones though, as TOS doesn't support more than 14 partitions and partitions larger than 512Kb (or was it 1Gb?).

>> How many SCSI devices can the TT SCSI controller access?
> 8 i think

7.

>> Is the TT easy to rackmount? In other words, is the motherboard small

>> enough to mount in a standard rackmount case?
> no, unless you mount it length-in, but that would be a hell of a rack case
> if a key is installed, the whole thing is too wide

The motherboard is small enough to fit in a 19" rackmount case, but you need to hack the ROM-port (desolder it, straighten the pins and resolder it) to fit any dongles. The same applies to the other ports on the left (MIDI and keyboard).

>> Is the TT easily moved into a PC-style case?

Yes. The TT has the same PSU as older PCs (AT), so if you still can find an AT-tower (it has to be tall!) you only need a drill and some screws to mount the motherboard. Oh, and a soldering-iron to make the port-extensions.

In article <s_roth-1912991427330001@spc-isp-osh-uas-04-40.sprint.ca> you wrote:
: Would they run in ST or TT mode (if there is such a thing)?

I am not aware of such a thing.

: Would they use TT or ST RAM?

Software normally can run in either ST- or TT-RAM but I don't know about Cubase etc. specifically.

: What is the maximum TT RAM expansion?

Depending on what Atari or third party card is used the limit might be 16 megabytes to hundreds of megabytes; but theoretically any amount of RAM may be attached up to a few gigabytes.

: What is the maximum ST RAM expansion?

I believe the maximum amount of ST-RAM that can be fitted with existing hardware is a total of 10 megabytes.

: What kind of SIMMs (if at all) does the TT use?

That depends on what kind of memory card you have. I have a AixTT card that uses 72 pin SIMMs. Others are available that use 30 pin SIMMs. Who knows whether someone has made a board that accepts DIMMs.

: Is the TT networkable to a Macintosh G3? How is this accomplished? What
: protocal is used?

Presumably ethernet would be the easiest; there are some VMEbus ethernet cards available with drivers for the TT. You could also use the serial ports if speed was not so important. Right now I am working on a SCSI to ethernet adapter that would work on the TT.

: What is the theoretical transfer rate (mbits/sec) of TT <-> Mac networking?

Well 10 megabit ethernet would give you 10 megabits (the actual throughput achieved with ethernet drops from this optimum figure when more than one host is using the network). Serial ports go up to 230.4 kilobits per second.

: When networked, is there a way for the TT to access my Mac G3's adsl
connection?

I suppose that the Macintosh can be configured to forward datagrams between the Mac-TT link and the Mac-ADSL link (i.e. configured as a gateway). I do not know about ADSL, but if the connection is ethernet then it may be easier to attach it directly to the TT rather than via a Macintosh.

: What is the largest capacity harddrive that the TT can have internally?

There is no real limit.

: How many SCSI devices can the TT SCSI controller access?

Like any SCSI controller, 7 devices apart from the controller itself.

: What solutions are there for accessing multiple SCSI devices on the TT?

Just connect multiple SCSI devices using cables in the same way as with
any other SCSI system.

: Is the TT easily moved into a PC-style case?

I think it could fit in a tower case, but I have not tried it myself.

I am not familiar with your music-related questions so I have left these
un-answered.

I just meant it doesn't make sense to throw money at the TT
when a 4-meg machine is fine I think TT-ram is app specific anyways

> >> Does C-Lab's Unitor2/ExPort MIDI expansion interface work with the TT?

Neither did I! But the latest version of Cubase is Cubase Audio Falcon,
which runs on any Atari (>1meg). CAF 2.06 is the version to get, although
Cubase Score is nice too.

> All I want the TT to do is MIDI. That's all! I'm sick of the

Pardon? What about the timing of midi on the Mac? Why not get another

```
cheaper Mac
that allows you multiple screens, current versions, etc?  Even an iMac would
work
And they are bloody cheap
I use Logic for all my automation, with Cubase as the main sequencer
Call me crazy

> PC style cases are cheap.  My G3 is in a rackmount already.
Please tell us how you rackmounted your G3.  Did you do it yourself?

> I have no problem with funds.
I have an SMP-II for sale.
```

256MB using two 128MB PS/2-SIMMs and a MagnumTT expansion card.

>What is the maximum ST RAM expansion?

10MB (2 on board + 8 on expansion card).

>What kind of SIMMs (if at all) does the TT use?

On board: None. TT-RAM expansion cards take 30-pin or PS/2, depending on how old the card is.

>Is the TT networkable to a Macintosh G3? How is this accomplished? What
>protocal is used?

Using a VME Ethernet card and MiNTNet: yes. Not sure if your music software runs under MiNT.

>What is the theoretical transfer rate (mbits/sec) of TT <-> Mac networking?

10MBit-Ethernet has a theoretical maximum of 1250KB/s, and I have seen above 1100KB/s (but not on a TT).

>What is the largest capacity harddrive that the TT can have internally?

Any SCSI harddisk with moderate power requirements should work - I think there are drives up to 73GB. If that is not enough, you could attach an external RAID controller or multiple disks ;-)

>How many SCSI devices can the TT SCSI controller access?

> ST.

That was a big mistake, the people at cash convertors are a bit crook;
and you could have
made cash for that stuff. All you had to do was post it in
aus.computers.amiga and it
would have sold within hours.

Your A600's would sell for at least $50 each, the A1200 possibly up to
$150 (likely more, it all depends on demand)

The genlock would also fetch at least $50..

Regards,

Ross..

I think you will have to adjust the SM124 because the new video rate is too
fast for it to show all of the information on a single display line. I think I
saw information online (many years ago) on how to increase the SM124 picture
by adjusting the internal trimpots. I guess the same idea would work here, but
first, you would have to reduce the "normal" picture size, so that the monitor
will be able to handle the "new" faster video signal.

>With 40Mhz clock refresh rate would be about 88Hz, hopefully SM124 can

There is a good chance the SM124 can work up to 88 Hz. Also, there is every
possibility the Sony will also work @ 60 Hz.

>Anyway, the general idea, If I try this, is to make the clock switchable,
>so that I can revert to original 32MHz.

Good idea. The only problem might be the SM124, you can't tweak the trimpots
everytime you want to change clocks.

Whatever you do, you don't have to reformat. Formatting a hard disk
drive is only required if it has bad sectors. Otherwise this is just a
wast of time since all the changes required to change or create
filesystems are done when partitioning.

> How to re-partition the hd on a mega-ste.

Btw, do we have anything like Partition Magic, on Atari?

I learned of a bug in MiNT that it doesn't report the correct maximum partition size, even though it increases TOS limits.

Despite that bug, it appears MiNT _does_ support partitions in excess of TOS limitations, so I would like to combine two spare consecutive partitions into a bigger one, to act as a scratch partition to prepare CD-ROM images.

All I really need is to erase the border between partitions L and M, to have a bigger partition L.

Do we have anything that does that, on Atari?

```

I vaguely recall that the partitioning-tool in ICD Pro could change the partitioning without loosing everything on the disk. In your case you would definitely loose everything on the "M", because there's no way the partitioner can know about every possible filesystem and manipulate it as required. But it should be possible to change the partition "L" to include "M", without loosing anything on "L". I don't know of any tools that actually does this though.

A few years back- I came across, a large group of Adventure International, software etc.   Basically I've got boxes and boxes of disc- in small cases) usually it's one game per case- and within the case are usually 3-6 disc. Some of these are normally alpha or "prototype" versions of the game and it usually contains what is labeled a "Master" disc.

AI had been based in the Orlando area, and this stuff had been placed in storage and ultimately sold for non-payment of rent. It would seem that this was the Adventure International "archives" or perhaps the separate backup storage- that was then lost or abandoned,   Much of the stuff is AI, but some is under another name- so I suspect that they either succeeded Scott Adams' Adventure International- or perhaps obtained the rights to some of the stuff.(or were a spin-off).

I got only about 1/3 of what was available- but it includes Atari 8 bit, St, Commodore, 64, TRS-80 etc. But still there are probably 100 or so separate cases- and maybe 500 separate disc.

There is also some cassette based software.

My interest is primarily the cartridge based games....
Any idea what this stuff is worth?
Offers? ....
I'd rather move this as a group/lot-
But if there is some particular title-   you really have to have-
if your offer will make it worth my while, I'll pull all this stuff out and search through it for specifics.

AI had been based in the Orlando area, and this stuff had been placed in storage and ultimately sold for non-payment of rent. It would seem that this was the Adventure International "archives" or perhaps the separate backup storage- that was then lost or abandoned,   Much of the stuff is AI, but some is under another name- so I suspect that they either succeeded Scott Adams' Adventure International- or perhaps obtained the rights to some of the stuff.(or were a spin-off).

I got only about 1/3 of what was available- but it includes Atari 8 bit, St, Commodore, 64, TRS-80 etc. But still there are probably 100 or so separate cases- and maybe 500 separate disc.

There is also some cassette based software.

My interest is primarily the cartridge based games....
Any idea what this stuff is worth?
Offers? ....
I'd rather move this as a group/lot-
But if there is some particular title-   you really have to have-
if your offer will make it worth my while, I'll pull all this stuff out

and search through it for specifics.

I downloaded Gemulator 98 and 2 versions of TOS, 1.04 and 2.06. I manage to get Gemulator to see both and then I've been able to run many of my old Atari programs but I'm have trouble with the Laser C development program.

Laser C loads- but- if I have Gemulator use 14 megs of RAM, Laser C will crash trying to open any code file or when attempting to make changes to it's config.sys file.

So, I adjusted Gemulator to only use 4 megs of ram on my Pentium, and now the above problem doesn't occur, but when I tried to compile a code file- it crashed and burned my PC operating system (Win95 OSR2)- I ended up with a black screen. I had to reboot, run scandisk, and it fixed a damaged file.

I don't get it. The author of Gemulator says it should work. I got a few messages from him, but few suggestions, and he seems to have given up on this problem.

The reason I still care to develop software with GEM and TOS is that I wrote some software that I've come to depend on in my conulting work. I now also have MS Visual C++, but that's a steep learing curve before I'm ready to try porting over GEM programs to Windows- I'll do it eventually, but in the short term I'd like to continue with TOS and GEM.

Anyone have any suggestions?

The Catalogue now has over 500 separate Atari Items.

1) New section of unboxed Lynx Games
2) New section starting for TT compatible game (feedback appreciated)
3) CD section mostly finished

Next will be working on the Utilities Section.

I plan for a pdf version of the catalogue or even a downloadable html...

Being new to the ST hardware myself, I ran into this problem as well, just a few days ago.

What you MUST do is use low-density disks, or tape over the other hole on your high density ones. Thats the only way Ive been able to get any results (although the ST will quite happily format a high density disk to 720 kb).

Ok, once youve got some suitable disks, use a program called HD-COPY to format the disks to whatever size you require (usually 720kb to 820kb is common from what ive seen). Take a look at the .ST file you wish to make an image of. Its size is slightly more than the required size of the formatted disk, so you need to format the disk appropriately. I know MAKEDISK has the ability for format disks as it needs them, but ive never been able to get it to work (it keeps going on about bad track 0 or some shit), so I always use HD-COPY to format the disk first up and then run MAKEDISK. Once the disk is formatted, run MAKEDISK to write the image (MAKEDISK /write diskimage.st /auto).

Wait a few minutes for it to create the image, slap the disk into the ST, turn 'er on and yer away!

It took me a while to realise the ST doesnt like high density disks that have been formatted on a PC to a lower format (for whatever reason). You MUST either use a low density disk or make sure the other hole is taped over.

Hope that helps (well, it worked for me!)

MC.

I have a SyJet cart that I has bad sectors so needed to reformat.
The problem is that HDDriver (v7.52) will find and report bad sectors on
the first pass and then ask if I wish to reformat taking this info into
consideration.
When I confirm this, HDDriver than tells me that it is unable to format the
medium...........
Knowing where the bad sectors are, I created a mini-partition containing
these and avoid accessing that part of the cart.
Not what I would call an ideal solution !

Jim

For my STFM I use a German-made 'Electronic Monitor Switch' to feed either an SM124 mono or a CM8852 colour monitor. This contains a multi-legged chip that presumably draws its power from the STFM, connected to a simple change-over switch to trigger it. It works fine and as expected (though it causes a reboot of course when operated).

When I connect it to the RGB adaptor on my Falcon, however, the signal is fed only to the colour monitor, irrespective of the switch position. To use the SM124 I have to unplug the switch and plug the monitor directly into the adaptor. Any idea why this happens? Does the Falcon perhaps not supply the required power for the switching chip?

Normally this is not a problem as I use an SVGA monitor, but the RGB setup is needed for some demos and games, and in some cases I prefer the mono monitor display even though it's smaller - it seems sharper and scrolls faster.

Regards, /Peter/

I have been going through a bunch of old stuff and found that I have a
tape drive, a Trakker 250mb, and was wondering if anyone knows if there
are any drivers for this for an ST, how to set it up, etc.  Has anyone
ever used these things on an ST?

Lewis -- you can use the mono monitor with no problems.

As for the other problems -well check the cable over for damage, then
check the TV for tuning on the channel your using.

This is because it sounds like a connection problem - test it on
another TV or try another connector.

Hope this helps

The message <8290dr$v48$1@uvaix7e1.comp.UVic.CA>
  from  "Bob Tapp" <rtapp@uvic.ca> contains these words:

> Has anyone been able to get a Maxtor 7213S or similar drive to
> work with the Mega STe internal SCSI host adapter?

> I have one that works fine on the Adaptec 2940 adapter in my PC,
> but not on the Mega STe's internal adapter.

> The drive has no terminators, no address jumpers (SCSI ID of 0)
> and has the "parity disable" jumper installed.

That could be the problem -- active termination is required !! Check
the Seagate - has it got a terminator?

> On the Mega STe, the original Seagate ST257N is recognized ok on
> start-up, but when I swap it with the Maxtor, I get the "Unit 0
> not available" message.

> The SCSI cable is a standard ribbon cable about 12 inches long.

> Thanks for any advice.

> Bob Tapp, University of Victoria

Newsgroups: comp.sys.atari.st.tech

The message <82ke36$doj$1@plutonium.compulink.co.uk>
from xlator@cix.compulink.co.uk contains these words:

> For my STFM I use a German-made 'Electronic Monitor Switch' to feed either an SM124 mono or a CM8852 colour monitor. This contains a multi-legged chip that presumably draws its power from the STFM, connected to a simple change-over switch to trigger it. It works fine and as expected (though it causes a reboot of course when operated).

This is because you are restarting the STFM in the 'new' resolution - colour is low/med res and mono is high res!

> When I connect it to the RGB adaptor on my Falcon, however, the signal is fed only to the colour monitor, irrespective of the switch position. To use the SM124 I have to unplug the switch and plug the monitor directly into the adaptor. Any idea why this happens? Does the Falcon perhaps not supply the required power for the switching chip?

That's because the only signal coming out of the RGB is a colour one !! There is no power requirement that is not being met as far as I undderstand.

> Normally this is not a problem as I use an SVGA monitor, but the RGB setup is needed for some demos and games, and in some cases I prefer the mono monitor display even though it's smaller - it seems sharper and scrolls faster.

> Regards, /Peter/

The mono monitor is sharper - it's high resolution compared to the colour output - which is either low (for most games) or medium resolution.

Doesn't your SVGA handle the games / demos ??

Regards Adrian HH

the mono monitor is fine and I have tried the other ssuggestions, I think
```

disconnecting the monitor lead (not the rf out) while the while it was on
could damage the blitter chip. I am not sure but I think this is the
problem, but I am looking for help.

Hi Jon and Chris!

What a coincidence: on a rainy day in december i'm having the same trouble: coverting ST imagefiles to PRG's readable for my ATARI 1040. I tried Chris' advice: I downloaded HD-COPY and Makedisk. I succeeded in Formatting a 720 KB to 800 KB. So far-so good. But I couldn't quite get the hang of Makedisk. How do I put an .ST file from my PC-harddisk to the newly formatted floppy?. I tried all kinds of commands in MAKEDISK, but they never seem to work. Maybe i'm not that good in DOS. Do I have to read the .ST file first and then write it to disk? Maybe you could help me?

Lots of thanks from holland,

herm

Hi Adrian!

Some demos are RGB specific, while some are SVGA specific, and of course, a few work on both.

Regards,

Jim W. Krych

I this is one of those drives that are connected to the floppy port, then no, there are no drivers for this and probably never will be.

I am trying to extend the SCSI chain on the host adapter which is part of the old Gasteiner Mega Drive kit.

This works well with the 2 original ST1096N hard drives and will manage them whatever IDs I set (so it's not restricted to IDs 0 and 1).

I have attempted to connect:

IBM DSAS 330Mb hard drive.
IBM CD-ROM

Archive Viper Streamer

which all functioned fine when part of a TT external SCSI chain.

On the Gasteiner host adapter I get no luck. The ICD and CBHD drivers fail to identify the devices. The ICD IDCHECK.PRG fails to find them. If I use the ICD SCSI.PRG to send Unit Ready? or Identify I get response code 2 with sense code 7F. Hummmm.

Does anyone know if I'm wasting my time here? Perhaps the Gasteiner h/a will only support and ancient SCSI command subset?

Thanks for any hints.

Roger

Isn't the tracker series one that hooked up via the Parallell port or
a speical card for PC's? If so, I don't think it will work on a ST.
A true SCSI drive like a Archive 150S SCSI tape will work on an ST
with the right software and hardware setups. (Diamond Back III works
with SCSI tapes.)

You can use a SCSI-I with an adapter called "The Link". Perhaps
SCSI-II with "The LinkII" but I'm not sure about that.

>If I can't find a hard drive, I'll consider buying an external

Hunt round for an old derelict PC. The 720K drives in those will work.

Try it on another emulator. See if it crashes there. You never know,
something in MegaMx may have got corrupted if it's been sat a while.

Following my original posting, I was invited to bring my SyJet to someone
who has v7.80 of HDDriver to try to format it with the latest version.

During the sector test, HDDriver reported 2 bad sectors at locations
1974381 and 1974516 with Last SCSI errors ASC/ASCQ $11/$97.
When replying to the re-format taking these into account, the format popup
reappeared and 40 or so minutes later the message 'unable to format medium'
was on screen.
No error numbers were displayed with this message.
If an error number was displayed before the last message, then I did not
spot it - and certainly did not press a key to get to the last stage.

Jim

First I want to state that the culprit of my problems was indeed a
defective SCSI cable. Causing the drive to shut down randomly and do many
strange things.

Second, You couldn't have described my drive when it is working any clearer
than the above. I have this problem often. And it is unrelated to the
cable. I have never known the drive to act differently. I just live with
it. At first I thought it was the 40 folder bug coming back to haunt me,
but it wasn't.

>I also think there is something wrong with your cable, either with the busy
signal line or with the>
>trmpwr line. Check if your drive has the onboard terminator packs. If it has,

>is power on the TRMPWR pin (no cable attached, pin opposite of cutout in
connector).
>(with the APPLE style 25-50 cables one insertion in the printer port and your
TRMPWR goes)

Yes, the cable was twisted and intermittant. As for the rest of the check
that would require looking:-). Thanks for the information, it is being
filed away for safe keeping.

Yo!, Dudes.

Does anyone know exactly what the SLB's supplied in the MAGIC 6
package do, and under what circumstances they are needed.

Do they only get loaded at boot or are they searched for as required.

I have a problem with the LOAD_IMG.SLB crashing the system on boot
and wondered exactly what i'm missing with its being disabled, or
wether it should be disabled in magx.inf and it loads as required.

Regards STEve.

OK. I will have to check what these error codes mean, can't do this right now. Most likely these are simple read or write errors, with no particular additional information.
If reformatting the medium doesn't work though for the second run HDDRUTIL tells the drive explicityly to map out the defects found in the first run, the drive may have encountered a serious problem. Can you try to format this drive on another platform (a PC, for example) or with another software?

It's online at
http://www.danbbs.dk/~dino/SCSI/

ASC $11 is an unrecovered read error, but ASCQ $97 does not exist in the
standard.

Does anyone know if Pagestream works with MagicPC? If so how do I choose
a Printer in buying a PC? Does it have to be a printer that pagestresm2.2
has a driver for or does it access the IBM drivers. I know Calamus99 will
access the IBM driver so I can buy just about any printer for the IBM
but Im worried about Pagestream. I dont want to buy a Lexmark and then
pagestream doesnt print to it. If this is so then please someone let me know
your advice.

Thanks. $97 indeed looked strange since such high numbers are not
covered by the standard at all, as far as I can tell.

Ok that may be just a bug in Laser C (i don't know that compiler)
>
>So, I adjusted Gemulator to only use 4 megs of ram on my

>Anyone have any suggestions?

Any decent emulator should _not_ crash the host OS, no matter what
the emulated programs do... (well ok, unless you allow direct
hardware access.) I'd try a different one... I use (rarely now,
but it is still installed) stonx, tho that may not be the right one
for you as its a unix program, running on FreeBSD here. (Unless
of course you want to put a unix or linux on your box besides the
windows but that would be a bit off-topic here. Here's a link:
http://www.freebsd.org)

What you could also try is a cross compiler, that would make the
compilations faster too as there's no emulation involved for that
anymore. gcc (GNU C, free) can be configured as a cross compiler
and there is a windows port of it too (called cywgin), although
i must say i haven't yet tried building a cross compilier on cygwin

myself, i have only done it on unix. (i was tired of waiting ages
for the compiles on the slow 68000...) I also remebmer i had to
apply external patches for the atari object format etc. (gcc itself
only knew the 680xx CPUs but not atari TOS) and atari binutils, i
think i still have the stuff somewhere on a CD but of course as it
is now several years old the patches will surely no longer apply
to the current gcc so you'd better look for a more recent version
yourself. (Or does someone here know where that could be found
now?) It _may_ also be that gcc now actually supports TOS by
itself (or MiNT, that should also work), but somehow i doubt it...

HTH,

:>perhaps not supply the required power for the switching chip?

The ST provides a 12v line on the monitor socket, maybe the falc
doesnt have this wired, or your adaptor isnt wired for it, do you
have the pinout diagram for the falc video socket??.

The hard disk had a hardware failure of the stepper motor, not a FAT
coruption or similar that could be casued by software...

> My experience is that most things that runs under TOS or MiNT also runs

I had a similar problem but never had it cause a crash. DSP viewer
of JPEG for example would just spit me back to the desktop without
showing a JPEG. Due to DSP locking?

I cannot comment on that. Random crashes certainly didn't affect my setup...

I guess you're right. Magxdesk is a separate program however, and conceivably ASH could throw Jinnee in with the MagiC kernel instead of Magxdesk...

> > But if only it would provide a less 'sticky' GUI response. There is no

> waiting, hogging the CPU in supervisor-mode).

I am refering to AES 4.1. I used to access the net with MiNTnet and when I tried to switch tasks with CAB getting data the whole shebang felt like cold molasses. Using STiK (under MagiC) WHEN it would work, was much less painless. I could swap tasks easily, start a raytracer, edit a text file, create a Works document etc...

> > doubt that magxdesk runs rings around it in terms of speed of response

> processes.

The slowdown I believe is almost not noticeable from my experience. If I adjusted the timeslice etc...I could always come to a good compromise.

> My experience is that it doesn't matter if you're using an Afterburner

Good point. Electrically the Falcon isn't really that sound...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hello,
Im wondering if anyone knows why I could not get my falcon to talk to a mac ultra scsi ORB 2.2 gig drive. I used AHDI but when I went to format it ahdi could not see it at the set ID. About the only thing I could get my Falcon to do is to recognize it when using cbhd at bootup, but after bootup it was gone; still ahdi could not see it. If anyone knows much about scsi like ultra or ultra wide lvd 2 or any of that let me know please.

Gene

Hi

For a list of SOME of the Atari items I have for sale, you can now use the following link. This is a temporary measure, until I get the new site up and running:)

http://www.the-asx.co.uk/txt/Forsale2.txt   in text (ascii) format.
http://www.the-asx.co.uk/txt/Forsale2.doc   in 1st Word Plus format.

Does AHDI identify the device when it is launched, but just not from TOS? Is the device ID set in sequence with the previous SCSI device. When using AHDI (unmodified) you must have your device ID's in sequence or AHDI will skip them.

I do hope that Apex Alpha can be released. Maybe someone can pick
up the program where it was left off and add some saving features and
enhancements if you and Doug would have no objections.

Apex Audio is a App I would sure liked to have seen come about.

I would very much like a Application/Utility that will Capture
Video from the Expose along with Audio and save the Video and Audio
into a common format such as AVI or MOV.
Maybe Apex Audio was intended to do this?

I can add sound to the video I capture with the Expose, using other
utilities. It would be great to get the Video and Audio together
at the same time.

Did you or Doug ever create a small program that would just grab both
the video and audio using the Expose and save it out as a file?
If so, I sure could use that.

Also, will there be any other updates to Apex Media? AFAIK 2.41 is the
latest update. The CT2B works very well with it. Maybe it could be
enhanced abit more for the CT2B?

Try the latest release of hddriver. Take the english demo from uwe
seimet�s homepage. Uscsi maybee work well if the "Ultra" part of the
drive bus is terminated correctly and the device made the communication
only 8 bit wide. Device doasn�t comes up to the maximum transfer speed.
Top transfer speed of any scsi device on any falcon is 1800K/Sec.

Mainly a problem of falcon DMA hardware.

DOITDRIVE contain tips in german language about that.

Regards, Robert

Assuming you are trying to access it as a single partition,
this will definitely fail: the Falcon TOS can access 1 GB
partitions at their biggest.

I suggest stuffing your hard-disk driver and MiNT 1.15.5 in the
auto-folder of a floppy, then boot with that. This should allow
you to access the drive, then partition it down.

Hi

I seem to have a problem reading CD-ROM's that have lowercase or mixed cased characters.. Is there a way to solve the problem or am I doing something wrong!!!

I'm using ExtenDOS Pro

You might need to upgrade to ExtenDOS Gold. With the gold version
I even get longfile name support with MiNT which aslo displays
mixed case.
I don't know if the pro version is updated?

this is what I use on Ataris both with Magic and single Tos,CD's that show
up as Mixed case on my PC show up as all upper case on Atari so I wouldn't
say Extendos is at fault all though there were a few patches for it a while
back but can't remember if they were for this problem

Nope, there are several, different country based DA sites. I think that
the Manual was on one of the more obscure ones, that's why I think that
DA central got it pulled. I still have a copy of the PDF file if any one
want's it.

Bob King.

Um - you are talking about wide, not ultra. Ultra is just 20MHz
transfer speed on the same number of data lines as usual. It can be
combined with Wide (giving UW). A narrow-ultra-SCSI device has no
extra lines which you could terminate on the 50-pin connector.

U-SCSI is downward compatible if you have ultra-capable (ie. active)
termination and cables.

Ups, fine. You correct me, my mistake, sure you are right.
I mixed both systems in mind.
Thank you! :)

Fine with me! Can you compile the UDO files? If not I guess the *.U
files will have to do :-(Just holler and I'll binmail them to you on Cix.

Regards, /Peter/

Ah - the one I did was 1.0. If someone can send me 1.1 I'll adapt my
translations. Note that I have the whole package, from the translation
started by Roger Cain, not just the docs, so it would be good to know
what files have changed, though I can check with Egale.

Yes, I had the same arrangement, which involved fitting a change-over switch to pins 19 and 20 of the Yamaha sound chip so you could use either drive as A and B. If switching is not needed, then just lift the two pins off the board and cross over the two connections with scraps of wire. BUT - as the Falcon does not have an external floppy socket, I am not sure whether this solution is possible.

I am getting ready to install a centurboII into my falcon.
I will send it out to have this done. However, I purchased a 72 pin
32 meg 60 nanosec parity simm board for the centurboII. Is this correct
? I have found that there is a 72 pin 60 nano second non parity
32 meg edo simm board. Which one is right or can I use either.
If I have to have the 72 pin edo then do I need to send my other board
back to pc connection for an exchange.

I nedd help fast in order to return the memory board.

thanks

Gene

Basically there were some clarifications, fixes and minor extensions to
the client-side interface.

Hi

The pc has let me down again! It slapped an uppercase 'F' into the
addresses. Try the ones below, as they have been updated AND give USD
prices:)

http://www.the-asx.co.uk/txt/forsale2.txt   in text (ascii) format.
http://www.the-asx.co.uk/txt/forsale2.doc   in 1st Word Plus format.

Atari doesn't use parity. There are restrictions on Centurbo RAM. See
the web site for details.

On which hardware might we ask are you developing games?

Considering the success of APEX media (my favorite Falcon program) this

is a
little disappointing to read. I'm sure there are thousands of Falcon030
owners that like myself were expectedly waiting for Alpha and Audio to
come out...

Is it possible to release the existing code to other developers who are still
in the Falcon world? Does Cortex have copyright over the source? If so
how much
will it cost me to buy the rights from them? It is too much of a crime
to just
let these 2 projects stay in 'vapourware' status for all time...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

Hi!

I'm thinking of designing an atari emulator, but with a twist.

Would it be possible to emulate the 68000, with memory, but without any devices and run well behaved GEM software by catching the trap calls for BIOS, XBIOS, AES, VDI and all the other standard calls. If this would be possible it would make it possible to re-compiler old atari software to run as a native applications under, for example X-Windows, Win'9x, etc.

Does anyone know anything about these speculations... please tell me your feelings about this.

/johan

AFAIK, the CT2 does not use parity, so it does not matter if your SIMM
has parity or not. Both FPM and EDO are available with or without
parity, but utually parity costs more.

It does require 60ns EDO chips, and it does not work with all of
these, so be sure to check the exact requirements.

This does work - in fact, this is just what the TOS2WIN emulator does:
it emulates a 68000 CPU, but all the traps point to some special opcode
that calls the emulator, and the functions (Gemdos, VDI etc.) are
executed native on the windows host.

It has the advantage that you get a good integration of the atari
programs into the windows desktop, but it fails with badly written
programs (direct screen access does work, access to LineA variables
etc. may fail).

Hello,

I'm working on MIDI stuff and I would like to have the MIDI codes for
the system messages :
clocks, meaning of the active sensing (what is it ??) etc

I already have everything about Note on/off, ctrl/prgm change, aftertouch,
polyphonic pressure, sys-ex.

Thanks for any help !

Vincent

Hi,

Why don't you join the NoCrew's OSIS project ?
This project aims to run Atari applications in multitasking with Linux.
The VDI part, oVDIsis is well advanced, so does oAESis. The emulator oCPUsis
is being tested successfully.
This project is open source (GPL) and the guys working on it are very nice :
try
http://nocrew.atari.org (I may remember)

You can develop it either on Atari with GCC or Pure C, or under Linux/X11
with GCC.

|> It has the advantage that you get a good integration of the atari

|> etc. may fail).

You shouldn't consider these badly written program. They are hardware
or _very_ Atari dependant, and they won't be compatible with machines
in the future : Milan, Phenix, Hades, or with new OSes.
Writting a reliable clean system is already a not-so-easy job.

Vincent

Must be an EDO, any other won�t work.
Watch for th no. "8" last place manufacuture code..

Regards, Robert

Hi,

I have been doing some cable-knitting today and tried to wire up a TT SCSI port (25-pin). I used the specification from Mark Baines A-Z Atari.

It's WRONG!! The signals are all over the place - I hope I have not broken anything.

Does anyone know the true 25-pin pin-out for the TT SCSI port? Or a URL where I can find it?

Roger

Try finding a copy of CHIPS555.HYP it has the proper list.

If memory serves me all the TT ports are shown in the TT manual
with pin-outs.

On Wed, 24 Nov 1999, Roger Cain wrote:

When reading some old articles in this newsgroup, I came upon this "12 MHz ST"
thread that has somehow slipped my attention when it was posted.

It sounds interesting- maybe even easier and still giving more performance
than just speeding the CPU's internal operations to 16MHz.

Can more details be made available? A circuit diagram? Also, what are the
consequences? I suspect that the SM124 might have problems with the 50%
higher scanning rate (overheating?). I suppose that one gets a small
640x400 picture in the centre of the screen- or is there overscan/lacescan
software that can handle this? Also, what with the colour video modes?
Would the higher scanning rate make them more suitable for a standard VGA
monitor.

What about the DMA port, as it seems that this will be accelerated too?
Will a SCSI adaptor attached to this bus still work- I got the impression
that this ACSI port is quite sensitive to cable type and length
(termination problems, maybe?), and this may get worse at higher frequency.

Is there anything else that does not work?

Thanx in advance;

Djordje.

It probably is, but there are problems. This solution needs a special circuit for clocking FPU, soundchip, DMA, UARTs (keyboard) etc.
If one solders VGA connector, then he could probably see mono picture on a bit better VGA monitor (with 12 MHz ST-no Overscan). WIth 16MHz ST it could become a problem to see a stable picture with VS 144 Hz as many monitors do not go that high, but with Ovberscan that could be solved (higher resolution-less pictures per second).

I have tried one ST at 14 Mhz years ago. I did not have the time to do it thoroughly, I have just changed main quartz (56 instead 32 MHz, so my machine ran at 56/4=14 MHz. It did generate videosygnal, which was visible on my VGA monitor, but that is all. Keyboard did not work (because of higher baud rate), same goes to almost everything else, but my TOS-IDE card worked beatifully as the IDE disk became almost twice faster instantly ! I could not test DMA transfer and I would exspect some problems in that area...

Actually, a lot of these badly written programs are still in use (and in many cases, no sourcecode exists). And yes, a lot of them run just fine on a Milan (sometimes only in mono or with cache off during startup, but nevertheless fully useable). For some, I had to make sure certain hacks in the TOS remain compatible, but most simply work as

```
long as the full environment they expect is there (including LineA and
other dirty stuff).

Dead right, Lonny, but I gave away the TT manual when I sold my machine.
What I am doing now is connecting the "SCSI-stack" which WAS on the TT to a
host  adapter and a Mega. So I need to map the SCSI bus onto the cable I
made for the TT connection. A boring session with an Avo would sort it out
but has the risk of making stupid errors!

Ah thanks, M-E, I'll look around. Of course, I went to your TT030 page
first, followed by Nic's quick FAQs but these didn't help :-))

Thanks., Michael, got it. It's VERY different from the spec. I was using. I
will do a few pin->pin comparisons just to check.

Thank you for that Michael. I know how temptative it is to get rid of crap.
The feeling of cleanliness is strong, but in the end you know you will shoot
yourself
in the foot.

In case you can't find it, this gives both the SCSI socket (which is near-identical to that in the Atari A-Z except that pins 22, 24 and 28 are shown as not connected instead of ground. But it also says (in my translation):

```
   The terminators with a TT030 are pushed into the sockets so that
   pin 1, marked with a circle, points in the directiopn of the CPU
   (i.e. to the LEFT)!

          Pin
           1 -REQ
           2 -MSG
           3 -I/O
           4 -RST
           5 -ACK
           6 -BSY
           7 -Ground
           8 -Data 0
           9 -Ground
          10 -Data 4
          11 -Data 5
          12 -Data 6
          13 -Data 7
```

14 -Ground
15 -C/D
16 -Ground
17 -ATN
18 -Ground
19 -SEL
20 -Data PARITY
21 -Data 1
22 -Data 2
23 -Data 3
24 -Ground
25 -TermPower (for TT030 and older Macintosh NOT connected!)

For active termination (+2.85V at 110 Ohm) the supply voltage of around +5Volt (from TERMPWR) is reduced by a 2,85 Volt regulator and then led to the signal lines of the SCSI bus via 110 Ohm resistors.

HTH!

It's not in great shape.. I don't know if it works. There are several pins that are missing on the connector that connects to the ST, so you'll need to figure out a way to fix it.

That's why it's free.. not that it's worth a whole bunch anyway..

First one to email me with their address gets it.

Hi.

I'm having trouble with vector fonts when running NVDI and TosBox
in resolutions greater than 640x400 eg. 640x480x16. The fonts appear very
tiny! I have read on the Official TOSBOX Mirror Site that
a utility called AFIX will remedy this problem but I could not find the
utility on that site (no response from the author of the site either).

I was hoping somebody out there knows where I can download this app or maybe
email it to me.

Thanks in advance.

> belong to a different process. Now do you like *that*?

You should have checked again. MiNT always aligns memory blocks lengths to at least a multiple of 16 (256 on machines with standard Atari video). Thus, off-by-one-errors statistically will only overwrite the following memory block with a probability of 1:7 (or 1:127).

But anyway, usually the problems causing MagiC to report "Speicherblock durch Benutzerprogramm ueberschrieben" are not only "off-by-one", but "off-by-many", so that the following block has been written into as well. It would be possible to add such a detection to MiNT, too (for blocks that have at least one byte left at their end), but it won't actually increase the security/stability.

> Not all of them, but some. And as it appears, it happens frequently
> enough for people to complain, right?

Sure, it happens (but these are usually not just off-by-one-errors). But this doesn't mean MagiC wouldn't need memory protection, nor does it mean that MagiC's scheme catches "completely different types of errors" than MiNT's PMMU-based memory protection. I assume that quite a lot of MagiC-triggering errors also trigger a memory protection violation under MiNT.

```
Ciao

Thomas

Thanks. I jumped aboard this one late in the piece and my message trasher
had already decided that the original was too old to grab its header...

One question makes me curious...how many AB040 owners have a STABLE MagiC
setup? I'm curious about that because from memory there were concerns
about the compatibility of the AB040 when it first arrived on the scene.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> I gave up after Magic 4.

v4.02. I'm not running it currently due to hard disk death some time back
(will have to build a desktop case for the Falcon now that I've discovered
that my new Quantum Fireball is too big to fit into the original case even
with serious removal of shield! :<). I will probably get MagiC 6 once all
is fully operational and new case is built...

> my sample player

<ON_TOPIC OFF>

Offtopic now, could you apply the BSS touch and compile a 'live' MP3
player? I have stacks of these on CD that I can only play on PowerMac
currently... ;)

<ON_TOPIC ON>

> Obviously I'm going to have a biased point of view but I have to say that in

> my experience Magic is very flaky in certain situations. On the setup I had, running Thing as AV server, any kind of AES messaging ran in to problems sooner or later.

I've used only Magxdesk as supplied (suits me fine - most get Jinnee or Ease or THING or other GUI's) and have had next to no trouble with AV server issues...

> The system stack space under Magic is very limited and leads to serious problems under some circumstances. These problems usually only surface in a development environment and the average user will rarely experience difficulties in normal day to day use.

Valid and good point. I'm no programmer, to the point that I can create useful software. A program to create labels for a plant nursery is as good as I have done using 1st BASIC...

> Magic itself is actually incompatible with GEM for a lot of cases - notably the pop up menu functions which require a patch to work. The patch itself is badly written though in it's defence I have to say AES patching is notoriously difficult and requires several rehooking procedures which have to happen in a certain order.

But are the incompatible functions better or worse implemented in MagiC? I would suggest some are, some not better...

> In my case I have found Magic extremely easy to crash to the point where the whole system freezes. While I can accept that this will happen when writing code, it happens all too often under Magic & rarely under MiNT.

So could I sometimes, but I learnt what causes the crashes and avoided doing those tasks in the particular way I first used. Note that the crashes I had observed were also likely whether running singleTOS (bleeurgh!), MiNT or MagiC - ie. they were only mildly OS dependant crashes. I also found MagiC could 'survive' some of them better than singleTOS, and sometimes better than MiNT.

> > GUI-wise MagiC wins quite handsomely IMHO...just look at the bother people have trying to get NAES...
>
> In what regard?

Availability, features. Obviously you cannot get a decent GUI for nothing for any OS, but at least the one bundled with MagiC is better IMHO than the free ones available for MiNT. To pay a little more for a bundled OS is a small tradeoff I can live with when it means I can install the OS AND GUI in minutes and be working away ASAP...

> Magic is not & never will be properly GEM compatible, there are far too many 'improvements' which prevent some older software from running properly.

Most older software should have been updated by now. If not it means it is not currently supported. If I want to run old old software I switch on my 1040STe...

> The other option for MiNT is the Atari offering which did actually improve
> no end, so far as to become properly multitasking, is compatible with all
> properly written GEM programs and, unlike Magic, is free.

But if only it would provide a less 'sticky' GUI response. There is no
doubt that magxdesk runs rings around it in terms of speed of response
to user input...just try running POVray in the background then go use
GEM-view, then maybe EvereST, then try task switching between apps...

> implementation of fastRAM buffers under Magic. This actually required an
> entirely different, and less stable, version of the AB040 toolkit to get
> Magic to work properly on that system.

Does this speak a volume for you on YOUR experience with MagiC? I have
asked elsewhere in this thread if AB040 owners experience similar to
yourself. I'd be highly curious to hear from other AB040 owners and
their experience with MagiC. The toolkit is quite a lot of patching
to get the 040 to kick in, considering the Falcon architecture isn't
as friendly to expansion port hardware implementation is it was touted
to be...maybe the hack and slash (to use a crude term, sorry!) level of
work needed to get the AB040 working is too different for highly worked
ASM code, as used with MagiC OS, to run safely on the AB040...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi Steve,

Steve Scott wrote:
>
> David has recieved over 20 phone calls from me in australia and continually
> promised results each week for the past 6 months.

I have read elsewhere that a member of Davids family is very ill and is requiring round the clock nursing from the family. That could most likely be the reason for the delays.

> Such a prick should not be allowed to take peoples money, he tells me that
> HE did not take the money, that it was TITAN Designs tha t took it and that
> TiTan does not exist any longer and that any responsibility THEY may have
> had to me (the consumer) is now NULL!

Thats not a very valid argument for him. His company may have changed name but that doesn't mean all previous correspondence can now be ignored. Has he actually 'cashed the cheque'? ie. taken money from your credit card or banked a cheque written out by you or your bank? Is that statement from him recorded or saved?

> Any feed-back appreciated.

The only feedback I can positively give is for you to contact someone else at Coretex, other than David, and get the full story. Explain the situation concisely, and talk ways of fixing the situation.

Failing that I'm unsure of the legal standing with regard to recovery of the money you may have sent. If Coretex have too little conscience to help you out here then everone else MUST know this in the Atari community.

Perhaps the biggest thing that concerns me is that Coretex do not appear to have put someone else in charge while Davids family problem continues currently. A threat to the life of a loved one is far more serious than your issue of value for money, but all it would take is for David to telephone for someone to run the business temporarily...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

MP works on all 030-equipped machines (except the CT2 I believe, please correct me if I'm wrong.), Afterburner040, Hades040, Hades060 and Milan040. I don't know about the Medusa.

> until recently it worked only for 030 machines. 68K machines and

Can somebody please explain to me why these emulators (except GEMulator, IIRC it emulates a 040) only supports the lesser CPUs?

But that's not the version you were talking about. Version 4.9x was only
available for developers since it was a (non-stable) beta version.

Multitos is not free. It was bundled with some machines, but that does
not make it free. IIRC, Atari even sold it for non-falcons.

I have never seen a translation and this is the first I time I hear that such a translation might exist.
Did you also translate the specification of the SCSI target interface?
Now that HDDRIVER 7.8 supports this interface and tools using it (SCSI_MON 1.10) are available this might be quite interesting. It should be possible to write a SCSI network using this interface. The future will tell whether this is actually possible and/or if somebody is going to write a network driver for SCSI. (I definitely won't.)

J, WILKINSON wrote:

> v4.02. I'm not running it currently due to hard disk death some time back

No wonder you're having problems if you're stilling using 4.xx. I had nothing but trouble with these versions on my Falcon, and that was a long time before I installed any accelerators.

> those tasks in the particular way I first used. Note that the crashes I had
> observed were also likely whether running singleTOS (bleeurgh!), MiNT or MagiC
> - ie. they were only mildly OS dependant crashes. I also found MagiC could
> 'survive' some of them better than singleTOS, and sometimes better than MiNT.

My experience is that most things that runs under TOS or MiNT also runs without problem under MagiC. The exception here is (was?) DSP-applications, which always crashed MagiC the first time I used them after a hard reset or power-on. After a soft-reset they worked fine.

The most annoying problem I had with MagiC back when I actually used it (4.xx-versions) was that it would very often crash for no apparent reason. I had only 4Mb back then, so I didn't run anything else than MagiC itself and a few applications, but even then it would crash randomly even if I just booted the Falcon and left it alone. Really weird.

I switched to MiNT+N.AES before MagiC 5 arrived (atleast before I got it), and I've been so pleased with it that I really haven't used MagiC seriously since then. But I've never been able to get it real stable on my Falcon, I've had my share of corrupted partitions, lost data and weird crashes (e.g. sometimes it refuses to load some sys-files, even

though they're definitely present and nothing has changed since the
last time I used MagiC. This can last for weeks or months, and then it
suddenly works again). On my TT OTOH I've never had any problems with
it, except for the boot-logging in MagiC6 which ate my boot-partition.

> Availability, features. Obviously you cannot get a decent GUI for
> nothing for
> any OS, but at least the one bundled with MagiC is better IMHO than
the free
> ones available for MiNT. To pay a little more for a bundled OS is a
small

The AES is not "bundled" in any way in MagiC, it's an integrated part
of it. Unlike TOS and MiNT, the GEMDOS and AES in MagiC can not be
separated from each other. This is really very different from the
MiNT+AES design.

> But if only it would provide a less 'sticky' GUI response. There is no

What do you mean by "sticky" GUI response? MiNT doesn't have a GUI...
If you're thinking of MultiTOS then that's a whole other issue, these
are not really designed for a multitasking kernel (lots of busy
waiting, hogging the CPU in supervisor-mode).

> doubt that magxdesk runs rings around it in terms of speed of response
> to user input...just try running POVray in the background then go use
> GEM-view, then maybe EvereST, then try task switching between apps...

Please keep in mind that MagiC automatically gives top priority to the
application currently on top (the one with keyboard-focus IIRC), this
contributes greatly to it's snappy feel but slows down background
processes.

> > implementation of fastRAM buffers under Magic. This actually

> their experience with MagiC. The toolkit is quite a lot of patching

My experience is that it doesn't matter if you're using an Afterburner
or not, atleast not on my particular Falcon/AB. I know two AB-owners
that runs MagiC stable, and a few more who can't use it at all. It
seems to depend more on the Falcon itself than the AB.

I believe the problem is that the AB increase the electrical load on
the Falcon-bus, and this worsen the timing-problems it already has. On
my own Falcon the SCSI-bus isn't stable in 20MHz when the AB is
connected, while it works at 24MHz without.

> to be...maybe the hack and slash (to use a crude term, sorry!) level
of
> work needed to get the AB040 working is too different for highly
worked
> ASM code, as used with MagiC OS, to run safely on the AB040...

There isn't as much "hack and slash" required as most people think. In
fact, most of the "hacking" consists of setting up the PMMU and CPU
cache correctly since the Falcon isn't designed with fastRAM in mind.
"TOS 7" in the CT2 does basically the same, and that's on a
"compatible" 030.

That is a good question.
The most disappointing is that none of them implement the coprocessor interface
(line f) native. Here I have a blazing fast pentium, but it emulates a ST program
that emulates floating point. :-(

Yes, I have the disc right before me.
It has MiNT 1.04 of Mar 5 1993 and GEM.SYS 4.1

That MiNT version wasnt free either.
It worked on my TT.

David may have taken some time in filling my orders, but he never
charged my credit card until the goods were sent. There was a sweat
once when I sent a cashiers check, but he pulled through in a few
months. The delay was because of the manufacture of the AB cards in
Germany, not really his fault. Wish him and his family well.

Note that the current SCSI Driver version is 1.01. If possible you
should ensure that you translate the current and not the old 1.00
specificiation since some flaws were removed in 1.01 and also at least
one important feature was added. Good luck!

I find it very very hard to believe he has used this 'excuse' as he has already announced that cortex is nothing but titan renamed. Dave has always held quality, good price and good service as highest priority and it is simply family matters that are keeping him from forfilling your request.

I would also assume that the money was debited from you though, as a key (the incorrect key but a key nevertheless) was sent to you.

There is nothing I can really say except it is not something Dave would let happen if he could prevent it but in his current situation, understandibly, his family comes first.

It's the kind of PSU used in all PC's the last couple of years. It's a
lot easier to find (and cheaper) than the old AT-PSU that plugged
straight into the TT and Mega STE.

There is a site with the Reference Manual for DA's Layout in English in
PDF format, but I can't find it now, perhaps it's been pulled.

Bob King.

Hello,

Following a recent discussion on upgrading ST's with an IDE card, the idea has come up to replace the internal floppy with a LS-120 but this would imply removing floppy A, leaving no floppy drive to perform emergency backups, should the hard-disk driver file on the main 2.5" IDE drive become corrupt.

Therefore, I was wondering if there is any way to re-wire part of the motherboard so that the floppy B connector becomes a floppy A connector?

I've had similar bad experiences with Titan in the past.
A Bad Nemesis with not one of my many e-mails to them regarding the problem replied to.
Even the original Nemesis Disk was bad, I sent it to Computer Direct (Titans North American Distributor at that time) and have never seen it again.

I should of just burned up the $150.00 plus dollars that I spent on that Nemesis, at least I'd got the pleasure of watching it burn.

Also waited at least 8 months for the upgrade to Apex Media.
Then after finally getting the disks, the main disk is screwed up.

I have exchanged e-mail with Doug Little, the Author of Apex Media who was very helpful and made sure that I got the upgrade

long before my Apex disks arrived screwed up.
Doug didn't seem to know what was going on at Titan either as from my understanding he isn't part of the company.

So another $25.00 up in smoke with my original Apex Media disk screwed up as a added Bonus.

In fact the only thing I have ever gotten from Dave or Titan that worked was some replacement ICs for my Expose Splitter. I had Major Back Surgery around that time and about the only thing I could do was talk on the phone, it took many pestering phone calls before we finally worked out a deal. Getting payment to him was part of the problem. And after a Credit Card got used, I did get the ICs and do appreciate that. But thats the only time I have ever gotten anything from them that worked.

My Expose and Splitter did not come from Titan Designs directly, but from a nice fellow in the UK and I'm very thankful to him as David would never sell me one. I still have all those e-mails discussing things about the Expose. David and I at one time did exchange e-mail. But after I got that Expose working things seemed to change. At least it seemed that way to me.

I wish I could find a couple of e-mails that someone in the UK passed along to me. It would have been interesting reading for you all.

As some of you may know there were some minor bugs with the NTSC versions. I for one would have done anything that I could to try and get the bugs out of the hardware so that another production run could have taken place. But Titan did not seem interested in getting the problems worked out or doing another production run.

They use to have the Expose advertised on their Web Page like they still had them for sale, been awhile since I've looked at their Web page though.

I am clueless as to why, The Expose is really nice when working correctly. I would think that alot of Falcon owners in the USA would have loved to have one.

From the info I have gathered on the Expose only around 25 to 50 were ever made. I have 2 of them, 2 working Splitters one PAL and one NTSC and 1 working Expose main board and one that is damaged.

ALot of the Exposes ended up damaged due to the minor bugs in the design of the Splitter in my Opinion. Not sure if the PAL versions were any better than the NTSC ones or not.

I would really like to see someone get the rights to the Expose and fix the hardware bugs which isn't that hard to do and make some more of them. Prehaps they can even be improved.

This is about the only hardware made for the Falcon that will do
Color Video, The Screen Eye is suppose to do color video as well,
but I don't know much about those. I do not understand why the Expose
has been kept hidden away for all this time. It almost seems to me
that someone doesn't want the Expose to be produced.

As for the Eclipse and Tempest, I do hope to see these things
come about. I'm not sure who designed this hardware. If it was
someone not associated with Titan, then I'd advise them to try
to find another company such as Centek to produce these boards.
From my experiences with Titan I'd say we'll be very lucky if
any of them actually are made to be sold. If its anything like
the Expose, only a few will be made and only a select few will
get working ones.

I do hope Titan/Core will prove me wrong on that. I don't enjoy
saying negative things about a company thats still supporting
the Ataris with new hardware and etc. Everyone can make mistakes,
lets hope they have learn from those and do better.

I know alot about having Family members ill. If this is the
case then I wish them well. I don't kick folks when there down.
I've been kicked while down myself and more than once.

While I'm on the subject, I'm always looking for working or non-
working Expose's and Screen Eyes. If you happen to have one for
sale or trade then do e-mail me. If you happen to know any interesting
info on the Expose then do pass it along here or e-mail me in private.

Centurbo 2 recommendation

After hassling with various accelerator cards (Speed Res Card, Nemesis, etc..) and normal Falcon,
installing clock patch and watching dongle CAF break down regularly due to the SCSI problems, I saw
CT2 in November 1998 for the first time.. It didn't take much time to register its speed and stability...
Unlike all I've seen previously this card really worked trouble free.
After considering the Centek's data at www.centek.fr I made the onyl logical decision: get one asap!
It is a real solution for every Falcon owner: speed increase is very good, screen resolutions are greater and
with a solid refresh rate, amount of upgradeable RAM is really amazing (up to 256 Mb on a rev. B machine)
- not even t mention the speed of CT2's fast RAM, SCSI now works with no troubles and connection of
modern and fast IDE disks (9 Mb/s transfer rate!) is almost trouble-free (2.5" to 3.5" adapter is a must...), the card itself fits in
Falcon's case along 3.5 IDE drive (almost trouble free ;)), some of the adjustments have to be made, of course,
(fan, finding space inside the case) and soldering is better to be made by a professional...The card has a flash rom
system (Dolmen) which controls the boot sequence and all neccessary parameters on Falcon. Hardware switch makes
possible switching to normal Falcon (not almost normal, since the Centek's clock

patch remains even in normal mode).

Possible modes (with modified TOS) are 4.0x and 7.0x (this is the mode when Fast RAM is used so the speed gets to the max...). Compatibility is excellent: everything works! Well, not everything - some demos, some old programs and games - but all the major packages work with renewing speed! Using APEX or CAF now gets really fast and safe, CAB gets wings with DSP clocked to 50 Mhz and jpg.ovl, Photoline, Neon or Phoenix are pleasure to use due to the 50 Mhz clocked FPU...

Falcon may be connected to all possible devices - scart VCR, SCSI devices (scanners, hdd, cd rom and cdr/crw...), all kinds of monitors (Atari SM series, VGA, RGB), audio components (hiss and crack free), fast modems, printers, DSP add-ons, etc.

My Falcon turned to real allround home computer with capabilities of some expensive platforms...

The price is always the big question and although I think it would be great if it could lower, every "nickel" you invest will surely come back!

Although Centek prepares its new surprise - Phenix computer - this accelerator card is a worthy contribution to remaining Atari enthusiasts and thing worth recommending!

Advantages:
- speed and screen resolution increase
- compatibility
- stability
- flash rom updates and system
- fits in a Falcon's case (although with adjustments)
- support (installation and there is special software written for it in order to use its capabilities)

Flaws:
- absence of extension slot on rev. B
- on some Falcons DSP and IDE speed have to be put on wait states (slowed down)
- adjustments to be made when CT2 is installed into Falcon's case (CPU fan and SIMM module are too close to keyboard, so minor adjustments have to be made)

Hi !

Sure there is a way to do what's you said. Somes years ago,
when i got my very first STF, it came with a single floppy
360 Kb, and so we use an external floppy of 720 Kb.
To allows the ST to use the external floppy as A, we just modify the
ribbon cable to get the drive select A and the PCB for the external
connector. I don't remember exactly what's to do, but this the main
idea.

Again, note the use of 'I think' - as a developer I was given 4.95 & this was the version number which sprang to mind at the time I posted the message. There was also an official release which Atari gave me the impression was distributed as an upgrade to Falcon owners. Atari User also had a mint setup on a cover disc which was (from what I remember) touted as PD. No doubt you'll correct me on that too.

After further checking I find that the officially distributed version was 4.1. There may be another after that.

Does anyone have a clue who actually has the rights to TOS/GEM - Hasbro maybe but I seem to remember an american company getting them at one point?

Dave

Hi

The drives A & B are connected in parallel, so all you should need to do is make sure that drive B has the ID:0 (or drive A).

Some external disk drives have twist in the cable to swap the drive ID lines around. There is no harm in removing your internal floppy drive and altering the jumper etc.. on your B drive:)

Let me know how you get on:)

I'm having problems with my internet clients at the mo, what do you expect from a PC! I would be grateful if some of the replies are also sent via email for me:) Pretty please.

For the time being please use the following address:

atari@euphony.net

Thanks

```

Note that the LS-120 is an ATAPI device, i. e. it has IDE connectors snf
must be wired to the IDE port.

I think part of the problem is that Titan themselves are prob not allowed to distribute the stuff in the USA as they have a deal with their us distributer and is them you would have to go through. As for the hardware, afaik, it is all designed by other people, Istari in the case of Eclipse and Tempest, not by Titan themselves.

Apex is an odd case. Dave and Doug parted a while back, not sure why - maybe one of them will tell us - and things on the Apex front kind of fell apart. Doug was supposed to be doung Apex Alpha but that seems to have been put on hold for the indefinate future - which is a shame cos I've seen a prototype and it's great. It's just what I personally need. Still, that's life i suppose.

That sounds fairly obvious to me.

The only point is for the external floppy to become drive A, so
that we still have a bootable floppy, in case of emergency.

Then, the internal floppy can be replaced by an LS-120 assigned
as drive B IDE:1 in HD-driver, while the internal 2.5" hard-disk
as drive C uses IDE:0.

Hi together,

I wonder if there are any Atari St-Emulators for PC on the market!? If
anyone knows, where to get such software and maybe iamges of original
Atari-Soft, please answer me here in the ng or by mail.

Thank you very much

Holger

[snip]

Weren't all STFs fitted with 720k drives?

AFAIK, the STF was only ever available as a 1040 STF, and hence had a "one meg" 720k floppy fitted. The STFMs with 360k floppy drives were half-meg 520s (The mid/late 1988 release of the 1040 STFMs had one-meg floppies as standard).

Or was the "STF + 360k drive" a France-only variant? (based on your .fr address)

I would like to add my voice defending Dave at this point. Coretex/Titan is a one-man band pretty much these days, without Dave there is no Coretex. A member of his family is desperately ill and requires one-on-one nursing and Dave is the only member of his family in a position to provide it. Ecliopse exists, I have one and I'm looking at a 21" monitor driven at 1280x1024x16-bit right now...

Quite frankly I have had a lot of problems dealing with people from abroad, especially with software arriving corrupted due to customs handling normally....I don't do it any more unless it's the only way...

Releasing the keys is piracy and I hope that the publishers of DA sue anyones arse off if they do it..

chrisc

TOS2WIN is definitly the fastest TOS emulator for Windows.
It doesn't need a TOS image and use Windows gdi instead of the Atari vdi,
but works only with well-written GEM-based software.
It can use custom graphic modes, colors... You can find a demo version
(unfortunately limited to monochrom) at www.aixit.com

I will trade you two chickens and a three corns for the beta, sir!
Really, I have been told that the beta exist, but have never seen
proof. If it does indeed exist, is the video capture function
implimented?

Hmm.. how about someone ask Dave if there is anything they can do to help
him with Coretex? I think that while in this situation, a little help
could avoid all this, unhappy customers and so on. Come on, help out your
friend! ;-)

>Still, that's life i suppose.

I asked Doug about Apex Audio or what ever it was finally called.
And was told that another guy was working on that but got another
job or something like that. It wasn't clear if that person was ever
going to finish it or not.

Do you or anyone else have a Demo, ProtoType or anything on Apex Audio,
Apex Alpha or whatever its now called?

If so, I'd sure like to get them somehow.

Maybe there were 2 or more Apex type programs in the works?
Anyone know for sure?

Magnus Kollberg (excuse the butcher of your name) has stated he has a
beta of Apex Alpha. I am sure that all the other "group" that is close
to Titan has a copy as well. I never really got much information about
it, how far the application is along, or if the video capture mode
works with Expose and the NOVA card. Maybe there are plans in the
future with it and Titan. I think it's kind of like Wizztronics saying
they have the source code for TOS 4.04, but are sitting on it for
their own purpose. It's BS.

There's a program ROMIMAGE.TOS in the archive of TOSbox which does this. You
may find it seperately if you root around in the Utilities section of a good
ftp site.

Go to "The Little Green Desktop" at http://www.lgd.fatal-design.com/

They have PaCifiST (DOS based emulator) and WinSTon, a windows one.

Both are pretty good, but both need a ROM image, but don't depair. These are
also available for download from this site, in various versions and
languages. You will also find plenty of downloadable game disks.

Have fun!

Adrian

See my earlier reply about Apex Alpha.

> If so, I'd sure like to get them somehow.

> Maybe there were 2 or more Apex type programs in the works?
> Anyone know for sure?

The whole Apex thing seemed to cause a little confusion in the market at large - Apex was supposed to be a brand as such, Apex Media being the first program. Apex Alpha, while being an art package was not an upgrade to Media but something more along the lines of Photoshop.

Apex Audio, my own contribution, was to be the ultimate sound tool but, due to various factors will never be finished. The current state of the project is nothing more than a GUI though some of the proposed sound drivers were used as part of the sample player I released. Unfortunately, both Doug & I have moved to the games industry & have very little time for updating of old Atari projects even if there were a suitable outlet for our creative talents in that direction.

Given the very limited progress of Apex Audio as an actual sound tool I can't see me making it available.

Dave

> implimented?

It really depends on what you term a beta - in our estimation, the latest version of Alpha would really be an early alpha if you'll excuse the somewhat mangled terminology. The package has a fairly well developed GUI but has no saving functions and only 2 real drawing tools. Video capture was implemented but only as far as displaying the video signal in real time. Alpha also has support for FastRAM & the Nova card.

I'll ask Doug how he feels about the program being generally available but bear in mind that, as we both have other jobs, it is unlikely ever to be finished.

Dave

FA: Atari Falcon computer, 14 megs RAM, external keyboard modification and clock patch done by ATY computer on Oakland, CA. This machine was in perfect working condition last time I used it. I have original packaging and all or most of the original floppies. No hard drive included. I also have the original 4 meg RAM card that will be included.

This machine has never been modified or overclocked except for the keyboard modification. I have used this mainly for digital recording using Cubase Audio Falcon.

TORONTO ATARI FEDERATION FLEA MARKET NOVEMBER 17TH!

Yes, folks, it's time once again for users of the classic Atari 8-bit, ST, TT and Falcon computers to come to the annual event where you can divest yourself of what you don't need while at the same time hunt out for what you do! Sell your old stuff, discover a treasure!

Among other things you'll find at this event:

classic systems! Looking for that Falcon? Wished you had an STe and its expanded capabilities? Do you need a 600XL for your collection? There's a good chance you'll find it here!

hard-to-find games, peripherals, literature and applications!

TAF Software Library, carrying hundreds of PD/Shareware games, utilities applications, as well as the TAF Internet discs! Plus we'll be selling 720K floppy disks, stock up! The membership desk will also be up for renewals as well as new members.

the camaraderie of fellow Atari users - swap stories, troubleshoot, ask for advice! Meet some of the faces you've only read online on the Internet!

Ken Macdonald's demonstrations and sales of the various Mario Becroft adaptors for Ataris. Use a PC three-button mouse with the Mouse Adaptor, plug & play, works with Ataris and Amigas! Use a PC keyboard, PC mouse and Atari joystick with the amazing new QwertyX adaptor, no soldering required! Give your ST or STe amazing storage capacity with the Internal IDE Adaptor kit - program storage, add a CD-ROM, use an LS-120 internal drive to replace your disk drive! And, with the VGA Adaptor, use any VGA or SVGA PC monitor with your Atari ST to get a beautiful hi-res display!

All this and MORE!

It's a night of fun and commerce, and it's being brought on by the one, the only, Toronto Atari Federation - bringing you the best in Atari-related computer info and enjoyment since 1984! See you there!

Flea Market details:

Admission and tables for TAF members: Free
Admission for non-members - $2.00 (one thin toonie)
Tables for non-members - $5.00 (admission waived if you purchase a table.

NO STOLEN ITEMS OR PIRATED SOFTWARE ALLOWED! VIOLATORS WILL BE PROSECUTED TO THE FULL EXTENT OF THE LAW.

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

assuming Magic ever works properly - I gave up on Magic & went to a full MiNT setup. Much better.

Magic has serious problems with AES messaging making it impossible to write code which doesn't crash on a regular basis. MiNT, on the other hand has to be the most reliable multi-tasking OS I have ever used on an Atari.

While trying (very unsuccessfully) to go to sleep just now, I was thinking of ways to cut down on my loads of electronic clutter here in the casa. One thing I'd like to do is get rid of my two old ST monitors, but I don't want to replace them with an almost equally as old and dysfunctional VGA monitor..

So, I was wondering if someone could give some input on an idea: Would it be possible to make a circuit to multiply the video frequency coming out of the ST? ie, potentially by sending each screen refresh twice in order to double the frequency? This used in combination with the Atari->VGA converter cables could conceivably allow the use of more modern VGA monitors that have higher refresh frequency ranges..

(See, I'd love to hook my Atari to my 17" Princeton Graphics monitor here..)

Any ideas on how/if this could be done?

Can I use SLM 804 Atari laser printer with Win 95/98, if yes where I can find the driver for windows?
Thank you and sorry for my bad english!

Hmmm... It will be very complicated. I think that you should think about buying Atari Falcon, which (as I know) has VGA output built in. Of course there are some graphic cards too, but it's same story (complications, expensive).

Just for fun try replacing your system clock quartz with faster.
If you had upgraded your RAM with faster chips (60-70 ns), it might even work on
twice the original speed. Oh yes, for that you need TOS in 120ns or
faster ROMs. That way, both your colour resolutions would fall in the 31
kHz region and you could have up to 120 Hz vertical refresh.
Mono resolution would work only on the best monitors, since its HS would
be around 70 kHz and vertical refresh 144 Hz ! Overscan should be able

to get at least 1024x768 at 90ish Hz or even 1280x1024 at almost 66 Hz or so...(theoretically-I haven't tried this)
It would be very interesting to see Overscan under these conditions, not to mention twice faster CPU.
Off course, yo would still have to several little problems, like FDC clock, sound generator clock, keyboard clock etc. but fixing these should be trivial.
One more problem is that ST's video circuitry has two video outputs-monochrome and RGB and only one of them can be active at any moment. This is also true on videoshifter itself, which generates digital video information (3 bits for R,G and B and 1 bit for mono) and shifter always puts unused outputs into logical 0 when inactive. So, the simplest solution would be to make small adapter and fit in it shifter chip itself and then fit adapter back into ST's mainboard. Adapter does nothing special except ORing each colour pin from video shifter chip with monochrome output from videoshifter chip and feeding the output to the corresponding pin in the socket on the ST's mainboard. All you need is 9 OR gates, which means 3 74HCT32 chips would do the trick and you would have a few gates to spend on buffering monochrome signal, since it has to drive 9 extra CMOS inputs. As I wrote, I have very succesfully used 74HCT series for that purpose, but you might be better off with 74ACT, since you would work on twice the clock rate...
Oh yes, one more thing. I have connected my ST on EGA monitor that way without frequency doubling (it still worked on 8Mhz) and results vere fine except nasty vertical raste in picture which was more pronounced in colour resolutions. I have tried everything just to find out that videoshifter chip was placed on the mainboard wrong way around so that it's own databus have caused severe noise on colour output lines and D/A circuitry. Since there is some 5 resistors, 1 transistor and noth much else per D/A, I have moved all 3 D/A's on the adapter circuit and result was unbelievable!

I hope the answer is not too long,

Branko

I don't want to turn is into a flame war and yes, I like MiNT, too,
but...

Sorry, but this is ridiculous. I have been using MagiC daily for
several years now, both as user and programmer, and never heard of any
problem with AES messaging.

BTW: which AES do you use on MiNT? I am not aware of an AES for MiNT
which is both complete, robust and GPL'd...

Hi all,

Is it possible to use SLBs with Magic 5.13 ? I know that it is
possible with single Tos, using MetaDos or BetaDos, but there is a
problem with Magic 5.

Is editobjc.slb freeware or is it only available with Magic 6 ?

Bye,
/Pascal/

there's always a but :)

> Sorry, but this is ridiculous. I have been using MagiC daily for
> several years now, both as user and programmer, and never heard of any
> problem with AES messaging.

Ok then try some VA_START handling under Magic. I wrote a sample player for the Falcon that uses this so you can double click on another sample while the last one is still playing. Under Magic 3 or 4 samples in a row & bang. Under MiNT & N_AES no problems. The sample player is on my site at
http://www.users.zetnet.co.uk/dmurphy
or
http://www.videlity.f9.co.uk

I find the 'memory protection' in Magic to be quite ridiculous & a waste of CPU time - it checks for a header at the start of every memory block & if it's not there then bang.

There's also the incompatibility with pop up menus & the patch for it that steals memory if you change res caused by TSR programs run from the STARTUP folder for Magic.

> BTW: which AES do you use on MiNT? I am not aware of an AES for >MiNT
which is both complete, robust and GPL'd...

Ok I have to concur on that one - N_AES is the only real choice for MiNT, most of the free ones I've seen are incomplete and/or unstable.

Hi,

I am looking for scans of homecomputer mainboards of the 70ths and 80ths. These scans I would like to add to my computing museum (http://www.8bit-museum.de).

Unfortunately a lot of scans are not available yet:

No scan available: :-(
Acorn, Amstrad, Coleco, Dragon, EACA, Enterprise, Excidy, Jupiter, Luxor, Mattel, NeXT, Osborne, Sharp, Spectravideo, Tandy, Tatung, Camputers and Exelvision

A few scans available: :-)
Apple (Apple I), Atari (2600 black, 800XL), Commodore (8032, VC20, C64, C64C, C116, C16, P/4), MITS (8800), Oric (1, Atmos, Telestrat), Sinclair (MK14, ZX80/81, Spectrum Issue 1+2, QL), Texas (99/4A), VTech (Laser 500)

Some of the scans are not very good and I will be pleased to replace them by better ones.

Who wants to help me but does not know how to make a scan or photo of the mainboard can ask for my advice. :-) A picture should not exceed 800 KByte (JPG medium).

Thanx very much

Stephan Slabihoud

Hi!

I recently inherited a 520STE, which I've upgraded to 4mb. I also borrowed a load of old ST disks off my brother, with the intention of using them on my ST and enjoying a bit of nostalgia.

So, I thought, these disks are a bit old, so what I'll do is to use Makedisk and create images of them, burn the lot onto CD, then if a disk should die, I can resurrect it. Great idea! Well, almost all of the disks work perfectly on the ST, but the PC has great trouble reading them, therefore Makedisk can't do it's thing. So, I decided to connect the 720K ST drive to the PC instead, and read from that. The only problem, is that the PC won't recognise the drive, despite changing it to 720k in the BIOS and running in DOS mode (i.e. without '98 loaded). Even stranger, is that a 720k drive pulled from an Amstrad PPC won't work on the ST either!

Oh yeah, the error message off the pc is "Seek error reading drive A:".

Any ideas, anyone? Failing that, anyone got a piece of software that reads a disk directly to an image, and dumps it down the ST's serial port? Thanks!

I've tried the demo version of Chatter. As expected I was unable to launch
it under N_AES but that chatter requires editobjc.slb was new for me.
IMHO this means that ASH is forcing people to buy/update MagiC 6. Bad
behaviour if you ask me.

I am in need of an external power supply for my Stacy 4 w/HD. The old one was destroyed after a flood in my basement. The old one is not an Atari but a Phihong PSA 162 switching power supply with a rating of 110V-240V AC 50/60Hz 55W and DC output of 16.5 /2.5 Amps. If anyone can help me locate a compatible one it would be greatly appreciated.

There is a hardware problem, the disk drive used for the ST machine isn�t compatible with DSDD units for PC. Only a little bit of units of STF were using the same kind of disk drive that PC is using. This ST can also use a modern high density disk drive standar as a 720k Atari drive, but most of Atari machines can not.

Has anybody got information on the Iomega ZIP drives, especially the new 250
meg one.

If possible, can anyone supply me with a copy of the software for the atari.

Thanks,
Richard B.

I think that in order to find out where the bug is, one would probably
need the source. I know that there are tons of programs doing VA which
do not have the problem -- in particular Gemini, for which this
protocol has been invented.

It's different from the one in MiNT, and it catches different types of
errors. I would like to have both in both operating systems.

Hi all,

From now until the end of December we are running a series of competitions on our website, the Little Green Desktop (http://www.atarist.com). Prizes up for grabs include new Atari ST CD-Roms, T-shirts, Games and a lovely boxed 4meg STE. All competitions are multiple choice and consist of three questions, the answers of which can be found on our site with a little research!

While there you could also sign-up for a free web-based email account at atarist.com, it takes a few minutes to apply for and you get a 4meg mailbox instantly and your own address.

Enjoy the SiTe!

Cheers,

Rich

I have another idee: remove all AES extensions since TOS 2.06 from MagiC and
let the whole atari world use WDIALOG.
This will at least bring an end to all the confusions about W. :-)

Sorry to butt in,

While your here, Dave :)

I worked with Doug a bit on Falcon Tripod under NTSC use.
There are still some problems with file saving. At times, say after
you have captured lets say, 30 or 40 images with Tripod, exit and go
to see what was captured, half of the files are wrote with 0 bytes.
The only way around this is to pay attention to the file size while
working, and if you notice a 0 byte file, exit Tripod and
restart to begin capture again. During the save process, the progress
bar seems to be working normal, and no visable difference between a 0
byte file and a normal file during a save.
Any ideas? This is on an AB040 machine, AB took kit stuff, under TOS.
I had the same problem under MiNT/NAES AIRC, and on my 030 machine.

Thanks,

Mike

has anyone used this program/accessory?
I've discovered that I can create colour
pallettes which are loaded into and used
by the system, but I can not save them!
If you have this program, do you have
similar problems? or is it something in
the set-up which I have not come across?
any help appreciated.
thanks.merci
ken

Just wondering,

can anybody with a copy of the service manual confirm wether the
PTC1426 is indeed built to specific 110 VAC and 220 VAC versions
or does it have a self-switching PSU?

Thanks.

Lots of music applications with original manuals:

- GenEdit editor librarian (with my own fabulous Roland D-70 editor thrown in for free) v. 2.0
- Band-in-theBox Gold.
- EditTrax Gold
- lots of system enhancing system utilities
- Lattice C development environment

Great for studio MIDI musician who wants a "plug and play" studio system or MIDI tinkerer.

$200 takes the whole thing.

I'm located in the SF bay area. If you need it shipped, that's extra.

Repost with additional info:

- Two SCSI drives for a total of 40MB disk space.
- SC1224 color monitor (also a B&W available)

Lots of music applications with original manuals:

- GenEdit editor librarian (with my own fabulous Roland D-70 editor thrown in for free) v. 2.0
- Band-in-theBox Gold.
- EditTrax Gold
- lots of system enhancing system utilities
- Lattice C development environment
- other stuff that I may have forgotten to mention. Both drives are almost full of software! I have manuals and original disks for most of it. The rest is downloaded shareware (nothing illegal).

Great for studio MIDI musician who wants a "plug and play" studio system or MIDI tinkerer.

$200 takes the whole thing.

I'm located in the United States, San Fransisco (California) bay area. If you need it shipped, that's extra.

No special ZIP sw is required. What you need (for the SCSI version at
least) is just a HD driver for SCSI.

Are you sure? I have twice replaced my drive with PC DD drives without
problems, later also a PC HD drive after fitting the required
```

clock-doubler. Mine is a mid-term STFM, originally with SS Chinon drive and TOS 1.02, later 1.04 and 2.06. The only thing I had to do was cut out the slot in the upper casing to clear the eject button - on some drives even this is not necessary. But as I said elsewhere, the ID must be set to 0 and the Shugart connector plugged in 'upside down'. But perhaps there are other Atari models where this deosn't work?

It's a shame this stuff is going to waste. I just don't use it anymore.

SEAGATE ST-157N (45 Meg) SCSI HD	$10
MAXTOR XT-8380S (380 MB) SCSI HD	$50
SC-1224 Color Monitor (Minus Vid. cable)	$60
Golden Image Hand Scanner (4", mono) with Scanning tray	$60

I'm in Florida in the USA, and buyer must pay shipping. If interested in any item, let me know where you are and I'll check into the mailing cost.

     Hmmm.. before I answer anything, you are
trying to run ST software on a 1040?  By the
wording, you are trying to run ST software on a
ST.  :)  What were you intending there?

I do not have the service manual for that unit, however, *all* atari
PSUs I have seen were either fixed 110/220V or needed to be switched
manually.

Assuming it is a switch-mode PSU, it shoulld be quite easy to find
out: look at the number and voltage rating of the primary caps, and if
the rectifier is connected in standard bridge or voltage-doubling
mode. Switcheable PSUs usually switch between standard and voltage
doubling by a switch/jumper for 220/110V operation.

I believe the first STe's were 1040's with STe rather than ST. I'm guessing
he was referring to his STe(?).

Its been awhile since I used my Mega STe for personal use (its operating as
my BBS presently) but isn't there a patch program to make software think the

OK, the basic web pages are now up, only two pages but it will be growing v.soon and hopefully v.fast.

The link is http://www.1632systems.co.uk from here you can link to Sales catalogue which should now be functional if a little sparse (graphically wise)

My thanks to those of you who have commented on catalogue and taking comments on board.
1) Hopefully postal rates are now sorted..
2) more graphics will be added with longer description, this will be over next two weeks.
3) On the web site, we will be archiving help files (cheats) for Falcon , Lynx and Atari games. These files will be available for download.

We do have other projects in mind so please let me know what you want to see.

Subject almost says it all. I have some SCSI equipment here that I would like to be able to send the SCSI commands to and see what comes back. There was a tool like this for the ICD utils, but unfortunately it only seems to work with the ICD Boot program running. Might have been pieces of it under the old Supra Tools as well. Since I am running HD Driver now though all those options are gone.

My setup for the process of elimination.

Machine TT
Scsi device hooked up to the external SCSI port of TT

I am running HD Driver software.

If no one has any ideas. Anyone know of any Unix command line
tools that are available with Source? I think if I had that and the docs
for the SCSI interface with HD Driver and I could get that much running.

Any help would be appreciated.

The documentation for the SCSI driver is available from Steffen Engels website: http://home.t-online.de/home/Steffen.Engel/. Note that there is no English documentation, only a German one.
You can use the SCSI_MON software to trace calls of the SCSI driver interface: http://home.nikocity.de/nogfradelt/atari_english.html.

I'm looking for a program called MSA2ST, which allows converting MSA files to/from ST files. Apparently, the Little Green Desktop has this, but whenever I try to download it, even off the backup server, it says it doesn't exist.

Does anyone know where I can get a copy?

Thanks

Hellraiser

Dan,
   Are you saying you don't have ICD BOOT or do you need the same type

of utility as comes with the ICD BOOT package but to be used with
HDDRIVER? If it's the ICDBOOT package you need, I'll be glad to send
you. Also (if i'm not mistaken) both boots can be used simultaneously
giveing access to both utilities.

Why not just run ICDBOOT before starting the tests, it will replace HDD until a re-boot.

However, if you suspect the troubles may be with HDD then this is no good!

I'm experimenting a little problem with MagiCMac6, the click of the mouse has a sort of delay, while the operations by keyboard are very fast. All the system works quick and good on this Quadra800, but you can see if you click to select for example an icon, that it becomes black (selected) after a small while, maybe a couple of tenth of a second, this is a bit frustrating when quickly clicking around on the desktop and applications. I experimented with various MagiCmac configurations (but I do not understand well german so it is a pain) , tryed with or without NVDI and other settings, anybody has an idea about what may couse the delay ? The mouse has not this problem in the Mac OS environment.

For what its worth, and drifting away from the original question,
there is a limited English translation of parts of the CBHD
archive on my website. Coupled with the contents of the original
archive there is enough to get the driver installed on a drive at
the very least.

Why then can I click at random in a directory of JPEG's, watch them open into 1stguide, and keep going (whilst they're still loading/depacking) until my RAM runneth dry? Seems as though the software is the deciding issue, NOT the way the OS handles the messaging...something in the way some software is written is obviously not MagiC friendly...

(BTW, I dont use 1st guide often, APEXJPEG 4.21 is much better! ;>)

> I find the 'memory protection' in Magic to be quite ridiculous & a waste of

> it's not there then bang.

I guess that is what happens when the very occasional software crashes by garbling its allocated RAM...MagiC gives me a nice message saying that the software has died and then gives me the desktop and other running apps back under my control. Very seldom has the entire ship gone down with one rogue app in my case...

GUI-wise MagiC wins quite handsomely IMHO...just look at the bother people have trying to get NAES...

Kind regards,

Funny enough, the issue of "AES messages not working properly in MagiC"
was raised together with the issue of how memory violations are
handled. Maybe this is not a coincidence, and the real issue is that
the aforementioned sample player actually dies because of the memory
violations detected by MagiC????

Regards, jre

What version of Magic are you using? Perhaps they fixed it in later updates.
I gave up after Magic 4.

If I prevent my sample player from starting a new sample until the current sample is finished then it's no problem. This is curious as it implies that the fault is timing related which is usually a good indicator of an underlying OS problem.

> until my RAM runneth dry? Seems as though the software is the deciding
> issue, NOT the way the OS handles the messaging...something in the way
> some software is written is obviously not MagiC friendly...

Obviously I'm going to have a biased point of view but I have to say that in my experience Magic is very flaky in certain situations. On the setup I had, running Thing as AV server, any kind of AES messaging ran in to problems sooner or later. The system stack space under Magic is very limited and leads to serious problems under some circumstances. These problems usually only surface in a development environment and the average user will rarely experience difficulties in normal day to day use. The average programmer, on the other hand, usually stretches his system to the limits on a daily basis & will uncover stress points on a regular basis.

Had the problem been one of software using improper system calls then it would be easy to fix, unfortunately the fact remains that the sample player behaves impeccably on a MiNT setup but not under Magic.

Magic itself is actually incompatible with GEM for a lot of cases - notably the pop up menu functions which require a patch to work. The patch itself is badly written though in it's defence I have to say AES patching is notoriously difficult and requires several rehooking procedures which have to happen in a certain order.

In my case I have found Magic extremely easy to crash to the point where the whole system freezes. While I can accept that this will happen when writing code, it happens all too often under Magic & rarely under MiNT.

> GUI-wise MagiC wins quite handsomely IMHO...just look at the bother people
> have trying to get NAES...

In what regard?

Magic is not & never will be properly GEM compatible, there are far too many 'improvements' which prevent some older software from running properly.

I have to say that the majority of problems with programs I have written seem to originate from Magic users. Standard TOS/Mint users rarely if ever report problems to me. Some might say that this shows my code to be unstable and in fact this remains the fallback of Magic users everywhere. 'I have no problem with Magic, it must be you' scream the masses. Unfortunately if you talk to most professional developers, Magic is the source of much angst due to convoluted work arounds for inherent system problems that the original programmers will not fix.

The other option for MiNT is the Atari offering which did actually improve no end, so far as to become properly multitasking, is compatible with all properly written GEM programs and, unlike Magic, is free.

Sorry but Magic will never be seen on my system again due to the vast improvement in stability I found by removing the thing.

I too liked Magic a lot when I first installed it but, as problems arose I began to realise that there were inherent problems with the implementation of core system components. FastRAM too has it's own difficulties due to the implementation of fastRAM buffers under Magic. This actually required an entirely different, and less stable, version of the AB040 toolkit to get Magic to work properly on that system.

Dave

I have personal experience of David Encill avoiding the responsibility of selling software (D.A.'s Layout plus Modules) which do's not live up to it's claim of being a cross-gradeable to the Mac O.S.

He Sold me a copy ($1200.00)Aus. under the pretext that a cross-over for a further 90 U.K.pounds, I could cross over to Mac O.S.

although I paid the extra over 6 months ago, he has only been able to send someone elses serial-key (which failed to work with the version/modules that I paid for.

David has recieved over 20 phone calls from me in australia and continually promised results each week for the past 6 months.

Such a prick should not be allowed to take peoples money, he hells me that HE did not take the money, that it was TITAN Designs tha t took it and that TiTan does not exist any longer and that any responsibility THEY may have had to me (the consumer) is now NULL!

I have not been able to raise the attention of the Programs' Author (Peter Egger) dispite advising that without support I may be forced to release the serial-keys in my possesion.

Any feed-back appreciated.

Hi, does anyone know where to get a replacement keyboard connector cable or info on how to make one for a Mega ST2? Also I would like to install an internal harddrive. what would I need to do this? what type of drive (scsi,ide or propriety drive)? What cable and mounting?

Thanks.

Rob.

Well. I never had any problems with Gemini as AV server, and this applies to all MagiC versions back to 2.0.

> sooner or later. The system stack space under Magic is very limited and

It certainly is not more limited than under Single TOS, right?

I think I hear that you say that some system limits are just bigger in MiNT/N.AES which might be true. Does this make MagiC instable? Only if you go way beyond of what actually would work under Single TOS.

> Had the problem been one of software using improper system calls then it
> would be easy to fix, unfortunately the fact remains that the sample player

Which doesn't prove anything. For instance, if you are writing just past the end of a memory block, MagiC will detect the memory protection, while MiNT will usually ignore it.

GEM in Single TOS doesn't even have popup functions MagiC could be incaomptible to. And note that MagiC 2.x was out way before MultiTOS.

> In my case I have found Magic extremely easy to crash to the point where the

Yes, but that's actually because MiNT doesn't attempt to catch those kind of memory violations. I don't think that this can be seen as advantage...

MiNT is, but N.AES isn't. So your point is...?

Regards,

Julian

If you have a Falcon, try the sample player mentioned in a previous message.

It does if the limits result in system failuree.

Excuse me but MiNT has a *real* memory protection system which will kill the
offending process *before* it kills your system. That is, of course, if you
switch it on.

The Magic 'memory protection' writes an annoying message & attempts to fix
the memory *after* the damage has been done. That's just a waste of time &
CPU resources.

In this case we're talking about AES message buffering & not memory
protection.

> > In my case I have found Magic extremely easy to crash to the point

> advantage...

See above - MiNT can & does catch those memory violations. Where it does, the system recovers cleanly in almost all cases. In the cases where it doesn't there's not really a lot anyone can do about it - mostly where the video mode has been changed & although the system has recovered, you can't see anything.

> > > GUI-wise MagiC wins quite handsomely IMHO...just look at the bother

> properly.
>
> Such as???

The pop up menu non support, the broken video bios calls, the 'improved' printer port output. All the stuff in wdialog such as window shading. The sorry excuse for memory protection.

> > The other option for MiNT is the Atari offering which did actually
> improve

> > properly written GEM programs and, unlike Magic, is free.
>
> MiNT is, but N.AES isn't. So your point is...?

My point is that, the Atari multitasking AES is free (4.95 I think) , as in the one that works with MiNT, downloadable from all good FTP sites.

Dave

Hi, I am the Atari NOS developer, and I am experimenting with MagiCMac 6. All works well in NOS as in other communication programs using DRVIN and MACM1 programs (what's the last version?) but I have sometimes problems to hangup an USR 33.6voice modem.

The problem is you can't use DTR but disable it on the modem with AT&D0, then just use escape sequence "+++" to put the modem in command state and give "ATH0" to hangup. For some reasons this does not always work, so there is a risk of unwanted long unused connections on the phone line.

I asked in some newsgroups and friends and got just this idea:

You can get DTR out of a Mac and you don't have to give up hardware flow control. The Mac uses the DTR internally to enable the drivers for the TxD+/TxD- signals. If you use a pair of diodes to combine these two signals you can recover a DTR signal that is suitable for hanging up the modem when the serial port is closed.

Dan Oetting <oetting@ghtmail.cr.usgs.gov>
-------------------------- END OF CUT ----------------------------
Obviously this is just an idea that have to be used by the software driver, is it possible to get this result on a Mac with MagiCMac ?

BTW any way to force a SECURE hangup on the modem is accepted if you can help!

 o> the modem when the serial port is closed.
```

It is not clear to me what you are saying, can you explain a bit deeper ? How is this DTR used and where would you put diodes ?

Would this solution work for all software then or must be specifically adapted ?

A drawing of the cable you suggest would be helpful.

Thankx.

Thanks for the ideas on the SCSI question I had.

I've found a bunch of the info I needed, however I'm now at the next point in my adventure. I grabbed the SCSI Driver kit and it does come with some nice code however it's missing the one thing that would make it really nice. A sample dummy driver.

Can anyone point me in a direction of some sample code that uses this to make a driver?

I know that I could probably figure that out myself from the code, but call me a lazy man who doesn't have as much time to program anymore as I would like.

Thanks,

Dan Ackerman

So how can it happen that some memory access failures are not recognized by MiNT? Be careful now: If you say that this is not possible, it shows that you don't know how memory protection with MiNT works ;-).
Julian is absolutely right when saying that it would be best if MiNT additionally supported the memory protection scheme of MagiC and vice versa. Neither MiNT nor MagiC currently detect any kind of memory violation. Some violations are only detected by MiNT, others are only detected by MagiC. Sounds like you're running some buggy programs that cause the kind of failure MagiC complains about.

> The Magic 'memory protection' writes an annoying message & attempts to fix
> the memory *after* the damage has been done. That's just a waste of time &

But it's better than not to report the kind of errors MiNT doesn't report at all.

> See above - MiNT can & does catch those memory violations. Where it

MiNT does not catch the kind of violations that are caught by MagiC. That's because the mechanisms applied by MagiC and MiNT are completely different.

> The
> sorry excuse for memory protection.

BTW, what is the excuse for MiNT not catching violations like writing to the first byte after a block that was NOT allocated by your process? Your comments sound as if you could justify this. So please go ahead.

I don't have a Falcon which is set up. How about posting the source, or
a binary which doesn't rely on the Falcon hardware and for instance
just fputs() the filename to /dev/console? I would be happy to test it
then.

If you really have a program that works under Single TOS but not under
MagiC due to system stack size problems, that is indeed a problem.
Example?

OK, try:

```
char *c = Malloc(10);
c[10] = 0;
```

This is a very common mistake.

Under MiNT with memory protection enables, this will *not* be trapped,
but it is harmless because MiNT has actually allocated 8K for you.
Under MiNT without memory protection enabled, this will overwrite
internal information in the memory list, and it will *not* be detected.
Under MagiC, it will overwrite a 4 or 8 byte long guard value, and
MagiC will report the problem sometime later (next memory related
GEMDOS call or something like that).

I must say that I prefer MagiC's behaviour.

MiNT with MP enabled is fine if somebody *else* overwrites your data
(because it will prevent that from happening). MagiC's checks are
useful when you are yourself overwriting past the block boundaries.

> The Magic 'memory protection' writes an annoying message & attempts

No, it is extremely useful for tracking down programming errors which
under MiNT would just result in obscure crashes.

The

3 of these 4 things do not have to do anything with GEM right. And I
think that in recent MagiC versions the popup functions are compatible
to MultiTOS.

Just because it is on an FTP server doesn't mean it's free. It's a
pirated copy of a beta version which was never released to the public.

It may be downloadable, but it definitely is not free, but an illegal copy.

Since the MiNT memory protection uses the PMMU, it will catch accesses that go beyond the page which you allocated. This is enough to prevent harm to other processes and to the system, but it it definitely not enough to catch programming errors.

There is sample code included that shows how to use the commands provided by the SCSI driver interface. Note that the sample code contains an incorrect check of the SCSI driver's version number. The code explicitly checks for version 1.00. This is an outdated version since 1.01 has been the current version for quite some time. You should either check for a version >= 1.00 or do no version check at all since the fact that the SCSI cookie is present already implicates that it's at least version 1.00.
I don't think that a dummy driver can be provided. Depending on the kind of driver you want to write things can look quite different.

It's clear that YOU and me and others know the difference but I wonder
if Dave Murphy knows. He doesn't from what he has written here up to
now.

They should be - my MSETUP (which uses the AES popup functions) runs
without modifications on TOS 4.06/4.08, NAES and Magic6 (Milan).

Hi!

reschke@muenster.de wrote:
> Under MiNT without memory protection enabled, this will overwrite
> internal information in the memory list, and it will *not* be detected.

No, it won't. Unlike MagiC, MiNT does not put memory block information like size, next and previous block, etc. in front or behind the block, but keeps a separate list. Otherwise, with active memory protection, you'd either have to store it /inside/ the 8K block (which would mean the internal information would be as vulnerable as without memory protection), or allocate another 8K block in front or behind the actual block for just that tiny bit of information.

Thus, instead, MiNT keeps a dynamic list of allocated blocks, which lives in a separate area, and is supervisor protected when memory protection is enabled. Without memory protection, of course, this list is vulnerable, but a process has to do a lot more than just accessing memory off by one to really hit it.

> I must say that I prefer MagiC's behaviour.

I don't. It's that chaining of the information with the allocated block that makes vital information easily wounded. Recovery is possible most of the time, though, but I still don't really like it.

> No, it is extremely useful for tracking down programming errors which
> under MiNT would just result in obscure crashes.

Erm, usually you don't (and shouldn't) use Malloc() for internal stuff
directly, do you? You use your library's malloc(), which handles larger
Malloc()ed blocks, and therefore off-by-n-errors won't trigger MagiC's
checks, either.

> 3 of these 4 things do not have to do anything with GEM right. And I
> think that in recent MagiC versions the popup functions are compatible

They have been earlier, though you had to install xmen_mgr to actually
activate them.

> Just because it is on an FTP server doesn't mean it's free. It's a
> pirated copy of a beta version which was never released to the public.

Exactly. And IMO, it's anything but useable because of many bugs and
flaws.

Ciao

Thomas

Besides, under UNIX, the priciple is exactly the same as in MiNT, i.e. you can usually write over the end of a malloc()ed buffer until you reach the next page boundary.

E.g., the following program will usually not segfault at index 10, but on a lot higher one:

```
-- snip --
#include <stdlib.h>
#include <stdio.h>

int main(void)
{
    long    *pointer,
    i;

    if ((pointer = calloc(10, sizeof(long))) == NULL)
    {
     fprintf(stderr, "Out of memory\n");
     return(1);
    }
    for (i = 0;; i++)
    {
     printf("Writing to pointer[%ld] ... ", i);
     fflush(stdout);
     pointer[i] = -1L;
     printf("OK\n");
    }
}
-- snap --
```

The best way for C developers to ensure they don't write past the end of malloc()ed blocks is using something like "Electric Fence" or "Memdebug", where the latter works flawlessly on Ataris, even with Pure C. "Electric Fence", however, is more powerfull, but needs things like mmap() which even MiNT does not have (yet).

Ciao

OK, I should have checked first. However: this means that the

programming mistake I discussed will actually overwrite the start of a
different memory block, which -- with MP turned off -- might even
belong to a different process. Now do you like *that*?

Not all of them, but some. And as it appears, it happens frequently
enough for people to complain, right?

Ok, got me there - I have to say I wasn't aware of the malloc'd memory case.

> Julian is absolutely right when saying that it would be best if MiNT

> cause the kind of failure MagiC complains about.

I don't deny that buggy programs are the source of the problems - what I'm saying is that in a lot of
cases the attempt to fix the memory error seems to trigger more errors. These cases, as far as I can see,
are the ones which overwite another process and would be caught by MiNT's mp system.

The mechanism employed by Magic, still isn't memory protection - it will of course show up errors in your program
but some errors seem to be caused by the lack of system stack space.

> > The
> > sorry excuse for memory protection.

boy have I started a thread now !!! :)

as I said above, I wasn't aware of this one - sound's a bit nasty too.

Dave

wasn't there a freely available one somewhere for use with MultiTOS - I'm
sure I had a better version for MiNT before I got N_AES.

Note the use of (I think) in the message we're talking about. There was a version distributed with MultiTOS at one point that seemed reasonably stable.

I was under the impression that it was free - I certainly got it free with my Falcon, including a later upgrade. Perhaps this was a developer thing.

If so, I apologise for appearing to promote piracy.

Hmmm ... the source is entirely assembly - I'll see if I can dig it out &
modify it for you. Don't hold your breath though - GBC development takes a
bit of priority atm.

> If you really have a program that works under Single TOS but not under

hmmm ... I'll get back to you on that - there were a couple of accessories
that had just those sort of problems.

Ok, as I said earlier - I didn't know about that one.

I would if it actually stopped the system from crashing, which it doesn't.

That's good news anyway - about time too. The last bit about wdialog is very much a GEM problem, considering that they are extensions to GEM & as such prevent users without Magic running some recent software. Not all of the extensions are available as a patch.

The printer port thing is sort of a GEM problem given that it causes all sorts of problems with printing on accelerated machines.

I wasn't sure of the version number which is why I put (I think). There was at one point a free AES for use with MultiTOS other than the original given away with the Falcon. May have been a developer update though so I may have to back down on that one.

Most of my opinion is based on the fact that I had nothing but problems with Magic and finally gave up after version 4 so do feel free to correct me on things which *have* been fixed. I'm glad to see it.

Dave

I must say that I prefer MiNT's behaviour here. It's very nice to be able to catch programming-errors, but it's more important to me that a process can not f**k with other processes memory-space without explicit permisson. Ofcourse, it won't be really useful until kernel-memory is protected too, but I already find it much more useful than MagiC's protection. Sure, MagiC will very often catch the violations that MiNT ignore, but 90% of the time the entire system will crash, while MiNT is much more forgiving.

A combination would be the best, but if you ask me to choose today...

> No, it is extremely useful for tracking down programming errors which
> under MiNT would just result in obscure crashes.

Indeed - atleast if you can continue working after the crash. IMO you can't most of the time. This might be caused by the fact that I'm using an Afterburned Falcon.

> 3 of these 4 things do not have to do anything with GEM right. And I

It is, from MagiC 5 IIRC. Besides, I happen to like MagiC's popups better, and I'm pleased to see that N.AES implement them as well... I wish this was the case when I started on Taskbar, that would have simplified things greatly.

> Just because it is on an FTP server doesn't mean it's free. It's a

I have to admit that I will probably release a MiNT-distro with this AES this weekend... (if I can get my Gcc-setup working again). Btw. who owns this AES? I've mailed Hasbro, but they never replied.

If you want to compare two MP-schemes you'd better enable both, don't you
agree? Even the best and most sophisticated memory-protection in the world
is pretty useless compared to MagiC's if you disable it...

That's true. But how many Ataris out there are actually able to run
MiNT with MP turned on??? The situation might be a bit better now, but
until recently it worked only for 030 machines. 68K machines and
emulators can't support it...

As a matter of fact this is what I said anyway. Both catch different
kinds of errors, both are useful, and it would be perfect to have both
in the same operating system.

I don't know who it owns, and finding out who is might be quite
complicated. Maybe Michael Schwingen as owner of single TOS can say
something about it.

That doesn't change the fact that it is copyrighted software that was
never released as "free".

You got it with your Falcon because MultiTOS was bundled with the
Falcon. This is different from being "free". For instance, XControl was
bundled with TOS 2.* and 3.* machines, and Atari *explicitly* released
it as freeware for older machines.

No, this was a beta version for developers.

Yes. True. I've done it in Gemini, I've done it in SCSI-Tool.

However the sad truth is that only a small subset of developers seems
to capable to do something like this. And for those "others", the best
education is to get a nasty console message from MagiC :-).

I handled this by watching writes to the DMA counter registers to get the address, then updating the contents of cache memory while the DMA operation is in progress. I can't remember the details but I could get it out again and have a look if this would be helpful.

This was necessary because during DMA the access address is not available on the address bus as it is generated inside the memory controller.

Maybe there is a better way.

Hi to all,

I'm playing with idea of new expansion card for Atari ST.
I would mount on it double IDE port, high freq. 68000, read shadow for
lower 4Mb of RAM, extra 10 MB of RAM expansion etc.
It would be a little help of having CPU working on 32 MHz or higher if I
would have to add waitstates when accessing lower 4 Mb.
So I want to shadow it ie. when reading CPU would read from 4Mb shadow
RAM on card and it would only have to wait when writing to lower 4Mb.
But I'm having troubles with DMA transfer, when DMA chip writes directly
to RAM (that is, ST's ordinary memory), so I haven't found simple way to
copy those transfers to shadow RAM also.
So, my question is, is there elegant way (through redirecting some
vector or something like that) through which could CPU after finished
DMA transfer update contents of RAM-shadow?
Another problem would be Blitter, but it is unnecessary since working
on only 8MHz it would be slower than CPU anyway.
It would be also interesting thing to have on card ISA-slot for ET4000
VGA card, especially since ET's RAM could be also read-shadowed on the
expansion card, thus accelerating animation on VGA card even further.
Judging from what others told me, VGA interface is cool thing, but
painfully slow.
Unfortunately, I can't find any info about MEGA4000 or ET4000 card
(register set etc.) in order to implement this feature.
I have tried to contact Torsten Lang (author of MEGA4000) through Email,
but so far received no answer...

Any help would be appreciated,

Branko

Thanks for very quick reply.
Extra details would be very helpful.
BTW, how do you "watch writes to DMA counter"?
Did you mean latching in external latches or some software way ?
How do you know when DMA ops. are in progress?
What interests me more is how do you know that DMA ops. have ended (like
finished sector access on floppy or ACSI) ?

>
> This was necessary because during DMA the access address is not available

I have thought of having extra CPLD with shadow copy of DMA counter on the
card. Each time that card would sense DMA-read transfer, card would "snoop"
data bus and use current counters state as address to update in its RAM... But
it would be complicated and it's a waist of CPLD.

Thanks in advance,

Branko

Hi there,

reschke@muenster.de wrote:
>
> <snipped arguments over MagiC/MiNT>

If I win the national Lotto I will BUY ASH licence to distribute MagiC, and threaten to give MiNT programmers HUGE sums of money if both parties could just agree to work together to solve the 'we are the standard - not you!' war that has quibbled away with unabated fervour since the very first time I got my Falcon on the net and read these &@%%#&$% newsgroups!

Dave Murphy certainly has arguments against MagiC for his chosen application (programming). Maybe he is best to say that for him, and him alone, MagiC sucks for what he does. I also think his issue is a little more complicated because he runs an AB040 (correct me if I'm wrong Dave!), and writes software with the aid of his (or BSS') inhouse programming tools (BSS-debug etc...) Not many AB040 are around correct? MagiC may not have been compiled with the numerous patches required to run an AB040 in mind...some tiny little patch may be causing the grief for Dave...

The MagiC camp also have their arguments against MiNT. The biggest issue is getting a consistent GEM compatible environment IMHO. MiNT kernel is of course free, but getting a GUI is a commercial venture in the case of NAES, and not a venture for non-german residents as I understand it? The freeware/illegalware GUI's are semi-cooked or just plain terrible (I tried TOS 4.92, but binned it after several goes at running it with MiNT 1.12 years ago). The other AES 4.1 was horridly slow on my accelerated Falcon...

Of course this is just how I found things to run...

Can someone give any constructive feedback here?

Kind regards, CW.

Latching in external latches.

: How do you know when DMA ops. are in progress?
: What interests me more is how do you know that DMA ops. have ended (like
: finished sector access on floppy or ACSI) ?

Monitor the bus arbitration signals on the CPU, when the CPU has relinquished the bus then DMA must be taking place.

During DMA, read the data bus when each word is transferred and store it in the cache while incrementing the shadow DMA address counter.

The shadow DMA address counter just needs to be kept in sync with the real counter by monitoring writes to the DMA address counter.

: I have thought of having extra CPLD with shadow copy of DMA counter on the
: card. Each time that card would sense DMA-read transfer, card would "snoop"
: data bus and use current counters state as address to update in its RAM... But
: it would be complicated and it's a waist of CPLD.

What you describe is basically what I have done. It is not as complicated as it sounds.

If you want some more specific details I'll get out the design files and see exactly what I did.

J, WILKINSON wrote:

> Can someone give any constructive feedback here?

Sure. The whole thread started with

a) "MagiC should be GPL" -- fine, but N.AES isn't free either,

b) AES messages do not work under MagiC -- they certainly do work for other people,

c) the memory "protection" in MagiC is "useless" -- it certainly isn't, because it catches a common programming error that MiNT doesn't catch.

Regards, Julian

On Sun, 17 Oct 1999 at 14:31:33 a message from Kukulkan was created on the subject of How can I get a copy of DC Format 3 and MagiC?.
>It stops at the DC logo. I DID use the right button. It worked in
>color, remember?
>
>It might be there's something wrong with the .rsc mono file...

Hiya

Nowadays I only use the program in mono!!!!!!!

Have you other programs, such as those that re-assign the rodents buttons!

You did click the right button ON the logo, I don't think it makes any difference!

Have you verified that your right mouse button is working?

For those that don't know, this is how you can check:)

Open 2 windows on your desktop.
Go to the windows that ISN'T selected and hold down the right button.
With the right button still down, choose an item (folder or file) and
select it using the LEFT button WHILE the right button is still pressed.

If all goes well you should have highlighted you selected item.

I know this works with STE's and a Mega STE, but have never tried it on
STFM's etc...

You may be thinking of Datalite 2. I used the program years ago and it seemed to be reliable and fast enough (on a TT, I don't know what it would be like on an ST). Unfortunately it didn't work with other not FAT filesystems under MiNT. Since then I no longer have a lack of hard disc space so I have never tried to use it again.

The best thing you could do is simply buy a larger hard disc drive.

Hi folks....

Major disaster...my PREFS>INF file got corrupt, I've tried to set it up again from scratch, but it's completely gone.....I found an old version of Newsie on one of my other hard-drives, and I've managed to get NG access...but itwon't let me pick up my mail.....HELP....I think it's something to do with my PAath Options and also the personal information.....Is there anywhere where I have tio enter any more account details than my password...

Chris,
Same problem here! All info in prefs.inf gets lost.
I keep a back-up. You can get the latest package (if you need) at:
http://www.primenet.com/~rojewski/newsie.htm

Okay,

I need to get ahold of some experts who really know how the RGB output of the ST/Falcon lines work. Why the signal is so different than a standard RGB out from an Amiga, and how to bring the RGB levels down to that similar to an Amiga.

Here is the reason:

The VideoTurtle, which I co-developed(it converts TV RGB, 15.75KHz, into S-Video and composite), works GREAT with many TV RGB systems. Problem is, the Atari ST/Falcon RGB output signal is not well liked by the VideoTurtle. We have litterally tried voltage dividers in cables, series resisters, we've looked at old home-brew adaptors, and Atari's own schematics, off of the internet.

I want to get the VideoTurtle to work with the ST/Falcon line. Please, don't tell me about the virtues of Scart connectors and the like, I am in the USA and that type of display is pretty hard for me to even find, let alone use. And, I am in no mood to debate S-Video versus Scart.

I just need some technical help.

Please email me with my given email address, if you are in the States, I am agreeable to calling you as well, so feel free to list your phone number. Canada is okay too.

I am not here to advertise the VideoTurtle, but rather, I am banking on the fact that someone, somewhere, in our Atari community, has dug into the RGB output of the ST/Falcon, and has some hard-earned tips for me.

I really would appreciate this, very, very much. You folks have come through before in regards to SCSI, for my 1040STe setup. Thanks again for your time.

Regards,

Jim W. Krych

Falcon RGB need a display that can syncronise 15Khz video refresh..
Also M1 and M0 sense pins on video connetor must be used in the right
way! That�s a MUST!

But.. if you have an accelerated falcon, RGB sometimes doasn�t work
well. Nemesis as example..
You got VGA well, but RGB needs some experiments.

Sorry, can�t say anw word about your video turtle.

You have any technical details about the video input of your video
turtle?

Regards, Robert

The ST, Falcon, and Jag for that matter use the same encoder (well
the Jag is a later type, but basically the same chip). As far as I
could tell, the Ataris are designed just like the spec sheet for the
motorola encoder chip. I purchased a quanity of connectors and chips
to bring out SVHS from the Falcon (or ST) and built a prototype board,
but have yet to build any of the 25 units I had planned a couple of
years ago.

I've never used MagiC yet, or any multi-tasking software! Well I do live
in Wales, that's my excuse:) Some companies release early or old
versions as PD, to tempt you to buy the latest.

Until I have tried it, I won't buy the latest version.

Hi,
Did have a Supra but when I wanted a 1 gig hard drive I found that
it wouldnot work as the HD was SCSI 2 this might be the same, I
undated to a LInk 97 and run a 1 gig Seagate, 540 meg Quantum, ??
CD-Rom and an Iomega Zip drive with HD driver 7.71 with no problems.

Has no-one answered you, Eric, since Oct 10? Let me try: plain TOS
cannot reach beyond drive P. Your TOS version is quite primitive; try
to download v 2.06 (?) and install that: it still won't reach beyond P,
but is better.

You meanwhile need to config SPIN as device A, then map it to the drive
on the desk, no later than P.

Unless, of course, someone knows better....

Cheers,
Charles.

I use devices that use the last 18 letters of the alphabet! and don't
have a problem accessing them.

If the file selector DOESN'T list these devices, you can always type in
the path yourself. I use the Ultimate File Selector v3 and have no
problems at all.

First of all apologies if you have read this message in another newsgroup.

16/32 Systems are setting up a new domain with full retail catalogue. At
the moment we have a basic catalog set up and will be expanding on this
every day, we plan to publish articles, help files in a general area as
well. I would like to make this a first or even second stop for Atari
Users. The catalog at moment is fully useable and if you wish to order then
please do so. Whilst we are knocking this area in to shape we will confirm
each price before sending.

However I require input, please browse pages as they come if you wish and
let me know what you would like to see either available or as general

interest. If you wish to contribute or have any other queries please email below. If you wish just to be kept informed then email me and I will add you to the list.

The reasons for this are basically due to personal (sickness) matters I am closing my shop and concentrating on Mail Order plus Internet stuff plus my contract work. So I am going to have a lot more available time and I might as well use it.

The URL at the moment is http://catalog.zen.co.uk/actinic/16_32_SystemsX/

You can now email me on nick@1632systems.co.uk or

Just a warning for anyone who has a Matrix tc1208 (early version).

A year or so ago I acquired one of these second hand for my TT. The D-to-A output chip is mounted on a daughter board which sits above and parallel to the main VME board. This arrangement permitted Matrix to offer boards with a choice of output sockets. Mine has a 10-pin D socket.

I did not realize that, particularly with a heavy monitor cable hanging of the socket, the back of the D socket was applying horizontal shear pressure to the chips on the edge of the main board underneath. Solder is not meant to withstand such forces.

A couple of weeks ago one of the chips, which are surface-mounted, came off. In most cases it was the soldered joint between the leg of the chip and the pad on the board which failed but three legs, presumably the last to fail, tore the solder pads from the board, fracturing the tracks leading to them.

Fortunately I have been able to repair the mess which resulted and I have filed the back of the socket so that it is now well clear of the chips.

If anyone has one of these cards I recommend a quick inspection.

David

I do.

MetaDOS supports 32 drives, no matter whcih TOS it is running on.

I've recently got a 520STE, basically just to have a bit of nostalgia and play some of the classic old games, such as Dungeon Master, but I have a few questions:-

1) Are there any major compatibility issues with the STE? I seem to remember a few, but this was quite some time ago.

2) Is there any way of adding a hard disk to an STE?

3) Or how about a CD?

4) I have a CD containing numerous disk images of ST games. Now, I realise I can use something like Makedisk to dump these images onto floppy, but this would be a bit slow. Is there any way I can get the ST to treat one of these images as, say, drive A? I mean, link the ST to the PC by the parallel port for example, and use a device driver for it. Does anything like this exist?

5) How picky is the STE about the 30 pin SIMMS it accepts? A friend has a few pulled out of an old 486, but I'd like to know if they are likely to work.

6) I know there are loads of sites with disk images of games, etc, on, but are there any with disk images of utils disks, with stuff like Assempro,

Devpac, Fast Basic, that sort of thing? I can get hold of the originals of most of these, but having been left in a cold, damp loft for the best part of 7 years, most of them no longer work :-(

7) And finally, what is the maximum baud rate you can drive the ST's serial port at?

Sorry if this goes on a bit, but I thought I'd get all the questions out in one go!

Cheers

Justin

Actually, this is just true of any driver using the hdv_rw intercept.
If the driver intercepts GEMDOS calls too, it can support any letter
it wants to. See, for example, MetaDOS or ExtenDOS (advert :-))

I alos tried to run a Sony CD-drive via the SCSI interface in my
Supradrive FD-10. Although the Supra interface could cope with a
Syquest SCSI-2 drive, it could not drive the Sony. Link 97 solved my
problem.

Some games are directly made for STe machinces, but other ones should
also work finde.

> 2) Is there any way of adding a hard disk to an STE?

DMA (Megafile)
DMA to SCSI Adaptor (LINK Adaptors)
Internal IDE Interface

> 3) Or how about a CD?

Same way. External, DMA to SCSI Adaptor..

> 4) I have a CD containing numerous disk images of ST games. Now, I realise I

I never hear about that and how it works.

> 5) How picky is the STE about the 30 pin SIMMS it accepts? A friend has a
> few pulled out of an old 486, but I'd like to know if they are likely to

Best way the simm had the same technical data as the simm what the
machine contain. Watch atari memory bank groups. So i can remeber me
that these STe2 must be upgraded bank wise..

> 6) I know there are loads of sites with disk images of games, etc, on, but

You are sure these sides are free, or they all piracy sites?
Maybee, damaged disks can�t bee reanimated. Needs a long time to pick up
working parts from any disk and you can�t got all data.
I�m not sure anybody put these utilities to the web.
Mostly these sides contain games..

> 7) And finally, what is the maximum baud rate you can drive the ST's serial
> port at?

19K2 without HSModem, without Hardware modification.
Save an old 520ST here, this machine contains "RS-Speed" so i have a
maximum serial baud rate of 115K2. But MagiC runs, als example, it�s
better to go down with the baud rate. (CRC-Errors with MagiC)
With single tos and coNnect 2.46, fine to use.

Regards, Robert

Any TOS can map CD-ROM drives to letters beyond P:, e. g. Z:. This is because CD-ROMs are handled differently than hard disks. Plain TOS doesn't support hard disk partitions beyond P: but this doesn't apply to CD-ROM drives.

This is an interesting idea. Indeed, would it be possible to make an Atari
regard a .ST disk image (it has practically become a standard) as drive A?
Then maybe, perhaps, eventually... some games etc. that have to be run from
a floppy might be loaded from a hard disk.

Cu.

Some games don't like STE.
>
> 2) Is there any way of adding a hard disk to an STE?

Same as with ST. External unit like Megafile, or SCSI host plus standard
SCSI drive. Some STE have defective DMA chip that scrambles hard drive.
Atari offered free replacement, but some non-hard drive users didn't
know they had bad chip.
>
> 3) Or how about a CD?

Add via SCSI host and driver software like ExtenDOS

>
> 5) How picky is the STE about the 30 pin SIMMS it accepts? A friend has a

>

Never had trouble with any I've tried, but some have said to avoid the 3
chip type.

>
> 7) And finally, what is the maximum baud rate you can drive the ST's serial
> port at?
>

19,200 without a serial upgrade. Even then, need a 16MHz upgrade to
properly process high baud rates.

OK, anyone know where I can get an IDE interface for a 520STE? How much?

Cheers

Justin

That was an old address. The current URL is:

http://gem.win.co.nz/

or to go straight to the IDE page

http://gem.win.co.nz/mario/hardware/ide.html

However there should have been a link from the old page to the new one. I can't understand why you did not see it.

Oops - I just became aware that in fact I muddled things and the wrong page was showing, that is why you could not find the IDE interface (or any of my other Atari products). I have fixed it now.

The URL is http://gem.win.co.nz/

Sorry.

Uwe, this isn ot really true. The only way to support drives beyond P:
on plain TOS versions is to hook into the GEMDOS trap and catch all the
relevant call. So you really can't say that TOS itself supports it :-)

I have an old SUPRA drive. I't been hacked some, as it used to be a 20Meg, and I'm not sure what it is now. probably 30 or more. Since I seldom use my ATARI equipment anymore, I'm not sure, but if you're interested let me know and I'll check into it. It has the built in ATARI to SCSI adapter mounted inside, so it's plug and play. If you'r interested, email me directly.

Oh, boy! It takes only one ignoramus to bring out the experts!

Thank you, Uwe -and others- who brought real help to Eric.

Eric, you can rely on what Dr Uwe tells you, despite all the info
that I and others have read from other Atari sources.

Happiness, all!
Charles.

Hi!

I installed a CT2revA in my falcon a year ago, and it works ok, except
for not being able to read floppy discs reliably and that the computer
is unstable in higher resolutions. The first problem I can live with,
but the second one is starting to really get on my nerves. It's always
like this when I try to run my ct2-falcon in a higher resolution than
the standard 640x480x16 colors:
I turn on the computer and enter, say, 740x528xTC, and it works fine.
But after approximately 5 to 10 minutes the computer crashes. If it has
been on for a while before I try this, it often crashes withing 5
minutes.

I don't know what's causing this, but could it be that I made a bad job
installing the CT2, that some soldering isn't good enough?

Regards
Henrik

Maybee trouble with Fast- / ST-Ram. Switch off, remove all RAM, replace
it all all try again.

Regards, Robert

Hi all,

I have an Atari Falcon. The problem that I am having is that I can't get my SCSI zip drive to work. I can only set the zip to SCSI # 5 or 6, but the Falcon keeps asking for SCSI 0. Do I need a special driver, if so, is it free ware??? Please help if possible.

Also, I would like to know if it is possible to hook up a Radius pivot landscape mono monitor. It comes from an old Mac. It would be great for running Cubase if possible.

Please send me an email as I don't get to the newsgroup too often.

Thanks in advance.

Just a thought, probably wrong, but sounds like a heating problem to me.
How are your heat sinks and fan?

Bob King.

Hi,

I have a ZIP scsi too and it work very fine at #5 or #6.

The only difference is that my SCSI driver scan all units until the
number 7.
I use AHDI and no problems...But i know that somes previous versions
didn't
scan all number. When there aren't an unit connected to a number, then
the driver
stop.

Whats kind of SCSI driver do you use ?

> How are your heat sinks and fan?

I only have the original fan of the motherboard and the one supplied
with the CT2.
The motherboard is in a tower case, standing on the left short side
(cartridge and midi side), but I don't think that should have anything
to do with it.
I think it could have something to do with heat too, given the symptoms
that's a logical reason. But I'll try anything I can come up with:
bigger fans, checking the solder joints, and removing/reconnecting the
RAM. Only need the time to do it...

AHDI stops scanning SCSI devices if it found a hole between the IDs.
Working: 0,1,2,3,4,5,6
Doasn�t work: 0,3,4,5
 "   " : 5

Use HDDriver or have a look around for an AHDI patch. Anybody tell me it
is avaiable, but i can�t remeber me.

Atari had his own monochrome, your display must have the same technical
data.

Regards, Robert

Hello!

Well, after a fairly long Saturday last weekend, in which my buddy and I went over the ST RGB signals with a fine tooth comb, two o-scopes. We do have some success!

First, we found that the Amiga itself outputs a 1.5V p-p with a 2V DC bias. The ST(1040STf) we measured, does indeed have a 1.8V p-p with a 1.2V DC bias, on the RGB signal levels.

In both systems, the sync signals were TTL levels. No biggie there.

We also found out that the cable I had from Redmond Cable, the supposed "new" one, was all messed up. The RGB lines were all tied together, and a sync line had a resister.

We also discovered a mis-print in the manual, DUH, the vertical sync polarity jumper was reversed, so that finally gave us a very stable picture.

But, the cable I am currently using, has just 33 OHM limiting resisters on the RGB lines. So, I get a real good picture, but I am limiting the picture to B&W right now. I have a new cable that brings the ST RGB to a level of .72 V p-p.

The moral of the story, don't give up, and pull out the big guns of debugging, and test the jumpers!!!!

I can't wait to have the Lost Blub demo on a 35" S-Video TV, or on an LCD Projector, with S-Video inputs!!!!!!

The saga continues........

I've got it (ahdiconf.app) on a CD-ROM (Stratos n.1). If it is not yet
available on a ftp site, I can upload it on lip6 and chapelie for
example. It's a program in German from... Uwe :-)

Bye,
/Pascal/

I'd advisde you to get and use a modernish version of HD-Driver...sounds liem the driver software is not up to snuff...CBHD for nutters who know what they're doing, HD-Driver for people who need good docs....ICD will do it OK too apparently but I've never tried.....ZIP's have a really bad SCSI

implementation so be warned, and the disks decay fairly fast too compared
to a decent MO drive or something like the LS120..

Ronald Andersson (if I've spelt his name right) had no end of troubles with a CT2,
which were only resolved by adding another fan to cool the ICs in the centre of
the
CT2 board. It would pay you dividends to try the same IMHO.

> bus lock ups.

And why?
Your SCSI Bus makes trouble in turbo mode. - SOME - CT2 falcons here
hade exactly the same trouble. Maybee, sometimes the easy way was to
kick of the oldes SCSI device out of the SCSI chain.

Best example here was a fucking IBM DPES 31080.
Devices works fine on all computers, also on CT2 falcon, but -not- in
turbo mode. Somethink you can�t found in any manual..

SCSI trouble is the key of all your problems.
(What i see after reading your description here..)

> What are the BEST settings for the hard disk array in combo with a
> CT2? (all the docs for Cecile are in French, and I don't really

What i mean, some lines upper..

It can be not an part of the user to try any SCSI devices for access in
turbo mode or not.

Keep Smile, i do exactly the same here as i got my CT2 Rev. "A"
I use it since november 1998, suprising that the "manual" ist allways
the same pice of paper ..

> Once again...ALL this stuff in a LONG chain works very well with HD-
> Driver 7 in normal mode.

Yes, but not in turbo mode..
Also Cecile doasn�t work well.

Try to find the "faulty" device that was doasn�t work in turbo mode.

Doasn�t waste your time for checking wires e.c..
If the board runs and the machine is stable, forget that.

DOITF030 contain a lot about CT2, but it is mostly in german..

Regards, Robert

Hi Mark. Please allow me to explain.

1st) I know cracked version is wrong (DUH) But that's all I have for
now. I stated before I want the real deal.. I don't like crashes etc.

2nd) "the nostaglic gift" was sarcasm. Maybe I forgot the =o) at the
end. I want to buy the real cubase., but Ihaven't been able to locate
anything on the web so far... thus your help.

3rd) Atari faq is the move, thanx Nick..

thank you both for your help
tracy

Hiya

It looks like the MSTE I have wasn't fitted with one:( It looks like
it's external only for me.

It's funny, when I upgraded the memory on the machine and even though I
noticed the big slot-headed screw, I didn't know the cover came off
until I fitted the ethernet card when it dropped off!!!!

So just go ahead and write those patches.

> The partition size especially is becoming a problem, as current drives

Simply use another filesystem like FAT32 or extfs2. There is no relevant
limit for these filesystems.

```

Hi!

In article <Pine.MNT.4.10.9909252349180.96-100000@rakastaja>,
Martin-Eric Racine <q-funk@funkyware.atari.org> writes:

> This doesn't make TOS see the extra partitions at bootup

So what? As long as your boot partition has a size supported by your TOS, this is no problem at all. Just put Big-DOS into your Auto-folder and the other partitions will then be accessible, too. The same applies for MagiC and FreeMiNT >= 1.15.0.

Of course, you need a decent hard disk driver for this to work (which will reserve a drive letter for oversized partitions and has support for XHDosLimits(), so no AHDI); but if you don't have one, getting one (HDDRIVER, for example), seems a better idea than demanding a new TOS (especially because this is a solution that works /now/, whereas hoping for a new TOS will only do in future, if ever).

> nor does it allow partitioning up to 1 GB.

I thought /you/ knew that the TOS version is completely irrelevant when it comes to partitioning, as this isn't done by TOS itself. It's done by a utility, e.g. HDDRUTIL, where the latter will just warn you about oversized partitions for the running TOS. If your harddisk partitioning utility refuses to create such large partitions, get a decent one.

> Sorry, it's no substitute for a newer TOS version.

Sorry, but if you choose to ignore the facts, of course.

Ciao

Thomas

I already use HD-Driver 7.xx.

I though _you_ knew that maximum partition size is TOS-dependant.
On TOS 2/3, one is only allowed up to 512 MB.  Otherwise, larger
partitions will be skipped at bootup.

Sure. Send me those TOS 3.06 sources, so I can get started.

```
> > The partition size especially is becoming a problem, as current drives
>
> Simply use another filesystem like FAT32 or extfs2. There is no relevant
> limit for these filesystems.
```

It's not a question of filesystem at all.

TOS simply doesn't find partitions beyond P, which prevents back up operations to/from large drives with more than 16 partitions.

Also, formatting utilities only allow partitioning drives up to what GEMDOS allows, in the TT's case up to 512 MB per partition. Even HD-Driver's own utility doesn't allow me to partition my drive beyond 512 MB per partition.

There is no way around the above problems; TOS _must_ be patched.

```

:-((Arrggh! You are SO right, Branko. Pin 4 of the monitor socket goes straight to pin 29 of the MFP with R28 as the pull-up. I must have got badly lost when I was probing before!

There is definitely 5v on R28 but the MFP then seems to ground it so that pin 17 is at around 0.2v. I guess this means that the MFP is broken.

I don't have any useful test equipment other than an Avo so it's difficult to test the GLUE. However, I can measure just less than 5v on HSync and VSync and around half a volt on Mono-out. Does this sound healthy? I hope so!

> Hope this helps,

It did, indeed, Branko, thanks.

Ah, <blush>, I made a mistake with my track tracing. It does, indeed, go to p29 on the MFP! There is 5v on R28 but p29 seems to ground it. I guess I/O 7 circuits have been damaged.

Thanks, Robert. I will go and search for a spare MFP.

Is it really necessary to post the same message in all the comp.sys.atari.xxx groups? For instance, we have just had a long (and interesting!) message about Degas bit allocations, but it was in comp.sys.atari.st, and st.tech, and also .programmers - which is a bit of a pain for those of us with slow connections and who have to pay both phone and on-line charges! And it is by no means that only one. Wouldn't it be better to restrict such messages just to one newsgroup, picking the most relevant one?

Regards, /Peter/

That's simply not true. They won't be accessible (without additional
software), but a drive letter will be reserved (depending on the
harddisk driver). At least, that's what Uwe told me, and I think he
knows better what HDDRIVER does, and what it does not.

Furthermore: How should Big-DOS ever be able to enable access to large
(DOS) partitions, if the driver didn't reserve the drive letter on
bootup?

Ciao

TOS is not responsible for "finding" partitions. It's the harddisk driver. If you use a recent and decent driver, it will mount partitions beyond P: in case the operating system supports this.

> Also, formatting utilities only allow partitioning drives up to
> what GEMDOS allows, in the TT's case up to 512 MB per partition.

That's certainly not true for HDDRUTIL or SCSI-Tool. And why would changing TOS help here at all?

> Even HD-Driver's own utility doesn't allow me to partition my
> drive beyond 512 MB per partition.
>

You are sbsolutely wrong. How could people be happily using bigger partitions on a TOS 3.06 equipped machine if you were right???

I have just checked it my machine and it sounds about right. I took the signal
at the TV modulator circuit, so it might be that it is inverted through some
buffer along its way to the connector...
If you have stable picture then Syncs are probably O.K...

If you're good you can do without them. Other people also could, like
Rainer Seitel when writing Big-DOS.

> TOS simply doesn't find partitions beyond P, which prevents back
> up operations to/from large drives with more than 16 partitions.

So use Big-DOS, MagiC or MiNT.

> Also, formatting utilities only allow partitioning drives up to

It does. Read the postings from today and you see that this works.
HDDRUTIL won't prevent you from entering partition sizes > 512 MByte and
will create such a partition.

> There is no way around the above problems; TOS _must_ be patched.

Others did and if your knowledge is sufficient you can do the some.

Thomas is right when he says that you can CREATE partitions of any size
regardless of the TOS version. The question is if you can USE these
partitions later with your version of TOS. You said PARTITIONING depends
on the TOS version and this is wrong. You can create partitions of any
size any time. But you might not be able to USE them unless Big-DOS,
MiNT or MagiC are installed.

Right, and I remembered that afterwards, although it _does_ point
out that my TOS's headroom is 512 MB.

> > There is no way around the above problems; TOS _must_ be patched.
>
> Others did and if your knowledge is sufficient you can do the some.

Not as in writing another BigDOS (we already have too much AUTO
folder bullshit). I mean, altering TOS sources and recompiling,
then burning a new TOS ROM.

This should be addressed in the MiNT mailing list since it's MiNT specific. MiNT comes with it's own filesystem driver and it's the MiNT driver that decides if a partition is accepted or not.

> Right, and I remembered that afterwards, although it _does_ point
> out that my TOS's headroom is 512 MB.

Pointing this out is very important and useful and not the same as not actually partitioning if you override the warning. You said partitioning didn't work and now you said it actually did work. Please try to be more precise here. Otherwise people think that there are problems that don't even exist.

What with Atari Corp. gone and the opening of GEM source code by Caldera:

Why not port the best of Atari GEM Windows AES into the Intel version? This
could be a whole new "linux" like movement on the internet!! There is even a
multitasking beta kit from Digital Research to work from.

Wow, the possibilities are endless!

This from a former Atari user who still loves the GEM OS.

>Regards, /Peter/

Hi Peter

Although I don't crosspost to the entire Atari related groups, I do
crosspost to a few. Now why do I do that?

Well the answer is very simple, some people only read one group. Yes there are people that only use group, maybe they are only interested in that specific subject, and may be interested in what will be posted. OR they could be a newcomer that has stumbled on one newsgroup by accident and doesn't know what other exist!

Also what may go unmissed in one group may not be in the other! I have replied many times to postings in the c.s.a.t newsgroup, or a.a come to think of it, that I have missed in c.s.a.

ATB
Steve

I now have a very sick Falcon :/

Trying to change the reisistor on DMA timing for CT2 and unsoldering the old one, the entire track pulled out of the mother board all the way to the chip...Actually, I think MORE THAN one track is ruined, and the damage is so bad I"ve no clue where the track maybe ONCE went to attempt building jumpers.

PCB was pretty scored and melted as it was...

Any chance at all of fixing this?

Falcon does NOTHING now...
NO boot screen at all...

Anyone in the USA want a shot at fixing this?

sigh

Brian

Oh man. Brian, I'm sorry to hear about your Falcon. I can just imagine how you feel-I'd be feeling the same way if anything happened to my beloved Falcon. ;-(

If I were you-I'd try Alex Yu at ATY Computers. He has done various jobs for me, and I've always been happy with his work.

Here is some contact info:

Alex Yu
Owner
ATY Computers

Dip switches 2 and 3 on the host adapter board are to change the SCSI
ID number. It goes as follows:

2	3	ID
ON	ON	0
ON	OFF	1
OFF	ON	2
OFF	OFF	3

Jumpers on your HD drive must be set to ID=0.

Dip switch 1 is set to ON at me but I don't know what is its function.

My Mega STE does have the stock SCSI interface and internal hard drive. The hard drive is mounted underneath the removable lid.

I think there is a small modification that can be done that will allow 2 SCSI hard drives to be used with the stock MegaSTE SCSI interface. I have the text file here on how to do it. Has anyone reading this done the modification?

If this modification is done, does it affect the limit on the SCSI hard drive sizes in any way?

And if two SCSI drives can be used with the internal interface can one be a hard drive and the other a CD-ROM drive or other SCSI device?

Also, if the interface is left stock, could one use it with a SCSI CD-ROM or other SCSI device instead of a hard drive?

I'm not clear on the size limit of SCSI hard drives with the MegaSTEs internal interface. Is there a limit? If so what is it?

I have a extra ICD LINK II that I'm going to use with the MegaSTE. Will the later versions of HD Driver work with the ICD Link II?

If so, are there any limits on the SCSI hard drive sizes with this
combination?

The MegaSTE manual pinouts for Modem1 and Modem2 on the MegaSTE are
abit different. Are both modem 1 and modem 2 wired correctly for use
with modems?

The manual also says something about using both modem ports at the
same time. So can I have 2 modems connected and use one for a Net
connection and the other for a BBS connection at the same time?

Thanks for any Info,

Hi

You aren't wrong, but you need a kernel to support an AES on Intel, and
currently we haven't any Atari compatible kernel available on it.
Perhaps, i will possible to use Linux, and write a complete GEMDOS, and AES/VDI
on the top onf Linux kernel.

BUT, what is this multitasking beta kit from Digital Research ?? I never
hear talking about. it was running on Intel ?

Hi!

Thanks for all the help in info and programs sent for me setting up my 1040STE and SCSI devices.

I gave up on the CDROM, BUT, I have a 340MB HD, a syquest 44MB, and a RICOH drive. All in a mini tower, with the AD SCSI Plus card in the case.

My Falcon has a CDROM, so the syquest drives will be used to share any "large" files. I replaced the Falcon's RICOH, with another syquest.

Thanks again for all the help and such, Atari Community!

BTW: where can I get a nice replacement desktop. I tried NEWDESK, but it crashed my system.

Regards,

Jim

Brian very sorry to hear that you had this trouble doing the resistor modification. I'll try to give you some info hoping that you can use it to fix your Falcon.
First thing when doing any soldering on your Atari, make sure you have the correct type of soldering Iron and solder. A 25 watt iron is fine and you can use a 30 watt if you are careful not to over heat the componets your working on. Anything over 30 watt will be too Hot and you risk heat damage. 60/40 solder is about right.
Also, try to get a short soldering Iron, the long ones are hard to do detailed work with. And also use a pencil point soldering tip for detailed work. And make sure that the soldering Iron Tip is clean. Dirty Iron Tips will not solder correctly. And can cause heat damage. If you have a dirty tip, take a knife and scrape it clean, then heat the iron and put solder on it. Then let the iron cool, before using. While soldering use a Very wet sponge or cloth to clean the Iron tip clean as you solder. It's very important to keep the tip clean when soldering.

Now on to your problem. As far as I know there is only one PCB track in the area where the DMA modification is done. If you have the CT2B paper Manual there is a diagram on page 3 or 4 which shows the SDMA (U36), the PCB track, and the AJAX chip (U20).
The PCB track starts out from the 2nd pin of U36. Start at the top left hand corner of U36 and count the pins down toward the keyboard and you'll find the 2nd PIN as we will call it. The PCB track starts at the 2nd PIN and runs straight across the board then makes a sharp turn up to go around 2 black inductors. I believe the first top inductor is labeled L66.

This PCB track has to be CUT into for the CT2B DMA modification and also for the 25/50mhz Nemesis Buffer modification.

Most folks cut the track right around where it corners those 2 inductors. So the only connection is to the 2nd pin of the DMA (U36).

First thing I would do is to solder one end of the 100 Ohm resistor onto pin 14 of the AJAX (U20) chip.

Then go ahead and solder the CT2B wire onto the other end of the 100 Ohm resistor.

Now for the connection on PIN 2 of the DMA (U36) chip.
Make sure there is no stray solder on the PINS of the DMA chip.
If there is, you must remove it some how. Either by some careful

desoldering, or by taking a small sharp knife point and scraping it off.

Alot of times, stray solder doesn't completely setup if it lands on cold Pins and etc. So its easy to just pick off if this is the case. Just be careful if you have to remove stray solder.

Now you should be able to use a componet leg cut from a resistor or other componet for the replacement PCB track, Or a small wire. If the original PCB track is completely gone all the way up to the PIN 2, then you will probably need to take a small sharp knife and carefully scrap the Top of PIN 2 so that you can make a soldering connection.

You'll need a length of wire or componet leg long enough to reach from PIN 2 to the Resistor/CT2B wire connection that you made earlier.

After you have all this right, go ahead and carefully solder the wire or what ever you are using to PIN 2. I would use only a small amount of solder and put some on the wire or whatever you are going to use as a PCB track first. If you could get a small amount of solder on the wire/etc then you could just touch the wire/etc to PIN 2 and heat it with the soldering Iron. Just be careful not to use to much solder or you'll end up connecting the other PINS of U36 together. You'll see that they are small anyway and close together.
A Pencil Tip for the soldering Iron is good for this connection.

If you can get this connection done right. Give it time to cool. Then all you have to do is simply connect the other end of the wire/etc to the Resistor/CT2B wire.

This should work if done correctly. AFAIK there are no other connections that will have to be made.

If you don't feel that you can do this, then any good electronic person should be able to do this easily. Maybe the person who installed the CT2B for you can do it.

If I read your posting right, you mention that the PCB was already melted??

This should not have happened. These connections are small and don't require enough heat that would cause damage. Just take your time and I think you will be able to do this.

If I can be of any other help just let me know.

I am looking for informations about a "watchdog" to keep alive my BBS system that runs on a TT.

Can you suggest an effective system ? I would like to have a look at the scheme but you can also suggest some already done blackbox to buy.

Thank you.

I suppose you mean: NEWDESK.INF? It is the config file for TOS 2.06 & 3.06

I rather good and not too big desktop is TERADESK.
I have seen it on several FTP sites.
It gives TOS's < 2.xx the functionality of the newer desktops and more.

 Hi Phantomm!

->I'm not clear on the size limit of SCSI hard drives with the MegaSTEs
->internal interface. Is there a limit? If so what is it?

  AFAICT, if you are using the internal interface, with TOS 2.05/2.06,
  then you will be limited to 512 megs per partition, and 1 gig hard

drives... (this sounds odd to me, but its what I got from reading
various posts)

->I have a extra ICD LINK II that I'm going to use with the MegaSTE.
->Will the later versions of HD Driver work with the ICD Link II?

I'm using ICD's Link II with HDDriver v7.61 on my BBS, and it
works fine there.

->If so, are there any limits on the SCSI hard drive sizes with this
->combination?

Under TOS v1.4, on my MegaST, I still can not use partitions that
are bigger than 512 megs. I can use larger than 1 gig hard drives
though-in fact, I'm using a 4.5 gig hard drive.

->The MegaSTE manual pinouts for Modem1 and Modem2 on the MegaSTE are
->abit different. Are both modem 1 and modem 2 wired correctly for use
->with modems?

I think that you can use both with modems, but one is limited in
speed to 19.2k, while the other one is high-speed. I think you can
also do a modification to make the slow port faster. Not sure
about all this though...

->The manual also says something about using both modem ports at the
->same time. So can I have 2 modems connected and use one for a Net
->connection and the other for a BBS connection at the same time?

If you are using a multitasking OS, such as MiNT (or that other
OS thingy-whats its name? Oh yeah, MagiC <grin>), then you should
be able to. Also, I think CoNnect will allow you to call out on more
than 1 port at a time.

->Thanks for any Info,
->phantomm@kih.net

You're welcome, and see ya! ;-)

TOS itself doesn't impose any limit on the drive size, afaik.
However, GEMDOS in TOS 1.04 to 3.06 cannot use _partitions_
higher than 512 MB.

> ->The MegaSTE manual pinouts for Modem1 and Modem2 on the MegaSTE are

> ->with modems?

Both are fully operational ports, but modem2 has a slightly more
complete set of hardware control lines. You can indeed use both
ports simultaneously, with a proper multitasking OS like MiNT.

A few years ago when I had my first ST, I installed a Real Time Clock module (From Dallas Semiconductors) inside my ST. Now that I have got another ST, I want to do the same. The program was called AREAL or something similar, and it came as a auto-load program which automatically retrieved the time and date from the module and set the ST's time. It also had an accessory which set the time initially. Does anyone know where I can get the program from, AND the installation instructions??? I have managed to get an old version of the program, but it hasn't got the installation instructions for the module with it. The files I have are called ar20boot.arc and ar20set.arc. Can someone out there help me, please!

thanks in advance.

OOOPS!!!!!

I meant to say Neodesk 2.0

SInce I have the manual and disk.

Thanks, will try that TERADESK

Anyone know the ftp sites?

Or, is it on the Suzzy B CDROM, or Atari Compendium CD ROM?

Jim

Subject: Samba Vs. NFS on MiNT
Date: 1999/10/04
Message-ID: <7t9nc2$sk0$1@zharh00t.europe.nortel.com>#1/1
X-Deja-AN: 532566120

Organization: Nortel Ireland Ltd
Keywords: Samba, MiNT, NFS
Newsgroups: comp.sys.atari.st.tech

Hi All

In the past, I have used NFS under MiNT to allow sharing of my STFM drives with a PC running NFS (all over the serial port).

There are serveral difficulties with this, the lask of a free PC NFS client being one (I used a demo of a commercial package), but I worked.
There is a lot of setup involved, espeically on the PC side.

I was since advised to use SMB (Samba), so I retrieved the archive & had a look.

My first impression is that it requires a lot of memory, the SMBD & NMBD daemons look to be quite large w.r.t NFSD. Is this the case?

I have a 4 Mbyte STFM, so, after loading KGMD, MiNTnet, there's usually about 2 MBytes left. The loss of another 0.5 to 0.75 MBytes under Samba is significant; NFS would only need another 0.25 MBytes or so.

Am I wrong in my assumptions here?
Is there some other good reason to use Samba rather than NFS?

Hi there! I have recently acquired a Falcon 030 16 meg with a skunk hardware accelerator and scsi board. Please mail me if you have any good sites /freeware/advice/text file manuals on setting it up for music (MIDI/Audio sequencing, wave editing, sampling/soft synths, and general op system stuff. I also have a Replay 8 cartridge for ST - does anyone know if this is compatible? Also, my machine has been rehoused in a tower - what keyboard/floppy drive/mouse/monitor? I think I haver some leads for SVGA connection, and I have a digital in/out from Steinberg as well.

Srorry...I know you guys have better things to do than help out a total idiot....
Thanks for your time,
Paul Flieshman.

P.S. If anyone has Cubase Audio Falcon for sale, mail me?

If you have any interest in viewing graphics then GET THE BRAINSTORM JPEG DSP DECOMPRESSOR...sorry to shout but this thing is a religious experience the first time you use it....Positive Image is a nice graphics program, so is Imagecopy, so is Gemview if you can find it....You won't need the Replay 8, the Falcon has 8-track 50kHz audio as standard....Get Aniplayer, if you like mods then get the Megaplayer, if you want to know the tiome get Clock...Buy an Eclipse......drink something every day that scares you....Dance, even if you're white, insult all your PC owning friends, someday soon, they will copme to their senses and the opportunity will be lost forever...welcome to the class of 99....

Yoy dont need your Replay 8 for the falcon coz its got A/D converter built in. (I guess you were gonna digitize sound?)
Didnt you get a keyboard/mouse/floppy with the falcon? You can have any atarimouse to the falcon, and via some adaptor you can use some pc-mice. When it comes to keyboards you can also have any from any atari, some like the megast and TT and need some soldering or so because the connection socket isnt the same.

same goes for monitor, you are better off with a vga/svga with the falcon, you dont really need a svga because the falcon cannot (not standard anyway) make use of it however, it is nicer to get a svga as they are usually newer and has a better display.

i hope this helped some..

/Fredrik (aka. deez)

Hi,

My old Atari mouse is now going wrong so I have been looking around for a
replacement,I have tried the Mouse burster from Cris Crosskey,that would
not work,may I add this is not a Mouse burster problem but my machine
problem.
I have tried old Atari mice,they did not work,when I refit my oldmouse
back I have to reboot the machine for it to work.My old mouse is the only
one it will work with.I also have tried another keyboard,that also does
not solve the problem,any ideas!please let me know Ta,Rob.

Hi,
My old Atari mouse is now going wrong so I have been looking around for a
replacement,I have tried the Mouse burster from Cris Crosskey,that would
not work,may I add this is not a Mouse burster problem but my machine
problem.
I have tried old Atari mice,they did not work,when I refit my oldmouse
back I have to reboot the machine for it to work.My old mouse is the only
one it will work with.I also have tried another keyboard,that also does
not solve the problem,any ideas!please let me know Ta,Rob.

What does the other mice do? If you do a cold boot with NO disk in the
drive does it work or not as this would rule out a virus problem.

I have a Falcon030 running Magic 5, NVDI 4, and all that. I currently have it connected to the internet with a PPP dialup connection using Sting. I would like to connect the falcon to my linux box (tcp/ip) so I can use th e linux server as a gateway. My questions are what is the best way to connect the two systems (hardware wise) I have a 10Mps network (10baseT). Is there a transducer to plug into the falcon's LAN port to give you a 10baseT? Or should I try a SLIP or PLIP connection? Has anyone tried this?

Not directly related to this particular problem, but a lot of malfunctioning Atari mice can be very easily repaired by anyone having just a little experience with a screwdriver and soldering iron. There are usually just three items:

1) A good cleaning of mouse parts helps. Dirt accumulates on rollers and the ball. Also, less visible, dirt acculululates inside the bearings of two brass shafts with the rollers. If the mouse is opened, the little piece of black plastic with the rollers can be taken out, dismantled and parts thorougly cleaned.

2) Malfunctioning button switches can be replaced for a trivial cost. One should watch for the height of the replacement switch- it should be as close as possible to original. Also, there is a design flaw in the mouse: when a button is pressed the switch takes all the load- which will, after a while, be too much for the switch. By careful adjustment of the height of the switch above the PCB (or by filing the part of the button

that touches the switch)- a fraction of a milimetre will do- the mouse can be modified so that, immediately after it clicks, the button rests on the mouse housing and not on the switch. In this way the switch is saved from the overload.

3) Mouse cable is of a very poor quality. Quite soon one at least of the wires in the cable breaks, and the mouse misbehave. Luckily, when the useless cable is disconected from the mouse, all the wires can usually be pulled out of the sleeve- and be replaced by thin teflon-coated wires. The teflonized wires shold be kept loose inside the cable, so there will be no more problems of twisting and straining. The connector will have to be replaced with a proper 90pin D connector, best with one having cable going out at 90 degrees angle to connecting direction.

Cu.

If you have an atari normaly any other atari mouse should work.
Check mouse connector on keyboard, computer pcb for broken pins.

Whitch kind of atari / keyboad you have?

MegaST keyboard? = 4/6 track cable from keyboard to computer.
Mouse/Joystick signals transfered serial thrue the same cable
as the keys used.

520 like, some more wires from keyboard to computer pcb used.
Check keyboard connector on pcb for bad solder points.

Other way, all machines, keyboard ACIA chip on mainboard goes down.
Needs a new ACIA.

But..

Check first all wires/connectors mouses..
Mostly i found the problem on that points.

Regards, Robert

I have the standard grey Falcon Keyboard,I have tried other keyboards but
the problem is still there,also other mice will not work,BUT the old mouse
is working ok(Getting worn out now)

It's a pity you don't live nearer, as I'd love to have a look at you
rodents.

I've got a couple of PC mice that won't work properly on a PC, one needs
the machine booting TWICE for it to work!!!! I still haven't fathomed
that out. I bought 6 rodents and have the same problem on both PC's!!!!

Hello

A technical specification question. I have a new MegaSte motherboard and want to know if there are scsi termination resistors on the mother board. A no is as important as a yes. If there are, where are they exactly on the motherboard and what do they look like? I am not talking about the jumpers of the asci internal controller card to which you attach an internal HD.

Thanks

Alyre Chiasson

This is very odd behaviour. Normally the causes of non-functioning mice are broken wires in the cable or poor solder connections to the 9 pin plug under the keyboard.

There's also a potential problem if you have a joystick plugged in that has auto-fire switched on, but I suspect that that is not your problem.

Are you sure that the second keyboard you tried isn't faulty as well?

Maybe it would be a good thing to check the mouse (or mice) independently of the computer- if you have the means. Connect the appropriate pins on the mouse connector to +5V and Ground, and see with a multimeter what happens to other signals when you press a button or SLOWLY move the mouse.

Maybe some (10K?) pull-up resistors might be needed between the mouse signals and +5V for this test? Ha! maybe that can be the problem- a broken pull-up resistor (or resistors) in the computer. That may explain why some mice work and some not- maybe the one that works has a slightly different circuit with driven "High" state, or something similar, so it does not need pull-ups in the computer.

Cu.

Hi

To aid UK Atari users, I am wanting to put together a UK Atari user groups list, if there's not already one.

So I'd really appreciate any info that can be sent me.

Please use the FOLLOWING email address:

usergroups@steverosie.demon.co.uk

Thanx

I want to connect my Falcon to my Linux workstation so I can use the linux box as a gateway to the internet. Can I use STing to handle the network connection through the serial (modem 2) port on the falcon? Or is there a way to use the LAN port on the falcon? All help is welcome...

> Has anyone tried this?

Hi,

no transducer available that I know of.
there exists a way to connect your F030 to an 10baseT network. This can be done by using a parallel port adaptor based on a Realtek 8012 ethernet controler and a special ROM-port device.
More info is available on these pages :

http://gallery.uunet.be/saka/atari/network/hot_news.htm#realtek

Hope this helps.

Thats what i thought,so i tried another keyboard,no luck.

No it's not that.

>Are you sure that the second keyboard you tried isn't faulty as well?

The second keyboard came from a working Falcon,i tried it while he was upgrading the Meg board.Someone had said poss the ACIA chip?

I am having a problem getting my NEC CDR-77 to be fully working with my ST. It is hooked up to my ST (2.5 mb, TOS 1.04US) through a SUPRA ASCI/SCSI adapter daisychained at the end of the bus behind a Quantum LPS52S. The Auto sequence runs like this:

Supra HD auto boot 3.00
Pinhead 2.1

SCSI-Trieber 5.02 loads and sees both devices (HD at ASCI 01 and the CD at ASCI 04). Metados 2.74 loads, sees the CD, give it its blessing and passes it to SpinCD 0.34 that mounts it as Z:

QuickST (version flashes by too fast for me to catch)
Universal Item selector III
HotWire 3

This is all fine and dandy. Z: is on the Desktop, but when I click on
it- the busy LED flicks once and then stops. The last I remember (when
I used the CDROM on my Amiga) the drive worked fine. Slow, but fine.

I am at my wits end on this and appeal most humbly to you all for help.
It is a bit frustrating having the Suzy B and Atari Compendium CDs
sitting in front of me with all of that wonderful software and no speedy
way to access them available. Help! Thanks in advance for your time.

:-) One answer I guess!

Wonder if it's a Nemesis-induced problem, ISTR that Rob had trouble with that.

Think of this:
Why is a reboot needed to get the old mouse to work.
(Unless a falcon configures the system at boot time)

On a (re)boot the floppydiskdrive is accessed causing a powersurge.
Maybe this powersurge causes some bad connection to temporarily go away and have the
keyboard to marginally recognise the old mouse.
I know, it really does not add up, but I would check the 5V rail in the keyboard if I
were you.
The mouse works through the keyboard processor and the only connection with the ACIA
is by send and receive from the keyboard.
As the keyboard seems to work the problem must lie in the keyboard to mouse
interface. The mouse is on the far end of the supply chain.
This may explain why the keyboard still works but the mouse won't.

They'd be just in from the ACSI port and they'd be SIL resistor packs I
would expect, though they might be a row of discrete resistors...I'm not
totally sure that ACSI had to be terminated like that thoughg I would have
thought so, although given it's remarkably short allowed cable run, maybe
it isn't rterminated....that's how IDE workss, keep it short and no need to
terminate..

Does anyone use a hard drive compression utility similar to those found in the PC world? My 40 meg HD on my Stacy 4 is getting pretty full. If there are shareware or freeware ones out there that would be great. I think there was a commercial program written by Oregon Research but I'm not sure where I'd get it or what it was called.

Oops, should have adeed that i can trade DTP and graaphical stuff to
some extent (ive got the originals for that)

Do you have any tips for ST download sites?

Thanks again

Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

How can I set the time & Date while using Hard Driver 7 Software and an ADSCSI Plus Host Adapter. My Host Adapter has a Battery Backed Clock/ Calendar. Still, I haven't figured how to set my clock/calendar on Boot up.

==Thanx==

Bummer, I have one of those in my closet. Alex can repair the traces, or at least jump from the chip legs to the proper point. The heart attack waiting to happen for most Falcon users is the installation of ANY of the accelerators that have been available over the years. Sorry to hear the troubles. Fix it yourself if you like adventure, but I would recommend Alex, it WILL cost less in the end.

Mike

For 6 years I exchanged data from my ST to PCs and visceversa. This year I bought an IBM PC300GL and an Acer Power. Both came with Windows 98. Is there a difference in formatting with the new machines? (OS/hardware?). Now I just CAN'T read the disks I used to!! The ones with files written on the Atari show nonsense characters on the PC and the ST just can't read the ones formatted on the PC. Any help? I found out that some disks formatted at 711Kb could be read by the ST but I don't know how to formatt such disks. (Win/DOS standard is 720). By the way, the more I use the PCs the better I like my ST.

HDDRIVER doesn't have anything to do with setting the time. This has to be done by special software, usually included in the host adapter distribution.

Yep I know the feeling well. I've moved most things on the internet over
to the pc's now, and I hold my breath when I add new software or an
update...

Normally you can format a 720k disk on a PC and it can be written and
read by the ST, that's what I do under Windoze '98.

If you have a program like, you've guessed it, DC Format 3 you can take
advantage of extended formatting as well (10 sectors per track/81 tracks
etc...).

check out DataDiet2 and Squish2(for programs)
hardly any slowdown for me, but rarely used
now as I have plenty of hard drive space.

It's probably due to a change in the BIOS. I've found that some PCs will read ST formatted discs, including some extended formatted ones, without any problems. Others, on the other hand, give the standard "do you want to format this disc" box.

>I found
>out that some disks formatted at 711Kb could be read by the ST but I

Format the disc to 720kb as that's the STs standard format. The FATs, directory and boot sector reduce the free space from 720kb to 711kb.

JET MOTO 3
THE RUSH IS BACK!

Sideswipe enemy racers, hang a hard left at the vertical grapple, and speed your way to the finish line! Jet Moto 3 takes you full throttle through 19 obstacle-filled, bone-smashing environments, as you attempt to conquer subterranean graveyards, ancient cities, volcanic eruptions and alien worlds. 11 insanely fast, all-terrain jet hover bikes, including new riders such as Angel and Convict, will take you on the ride of your life as you jostle, sideswipe and fight for position against the most challenging racer AI to date. You’ll feel every bump, bruise and crash with the all-new 3D racing engine with MotoPhysics⍰, delivering blazing fast gameplay and crisp, beautifully detailed 3D graphics. Jet Moto 3. THE RUSH IS BACK!

KEY FEATURES:
⍰ Race any of the 11 ultra-realistic, all-terrain jet hover bikes. Old favorites like The Max, Wild Ride and Vampeera team with new riders such as Angel and Convict. Each rider/bike boasts his or her own performance ratings for acceleration, top speed and handling.
⍰ All-new 3D racing engine with MotoPhysics⍰ delivers blazing fast gameplay and beautiful 3D graphics. Experience outstanding handling and even an occasional horizontal and vertical grapple!
⍰ 19 treacherous, bone-smashing environments to conquer, including an ancient Inca city, a subterranean graveyard, the gut-wrenching SkyPark, as well as the wildest, most thrilling stunt tracks ever designed!
⍰ Feel the effect of eleven different racing surfaces, such as ice, wood, metal, rock, lava, grass and concrete.
⍰ Experience realistic weather effects including snow, rain and night racing.
⍰ Challenging AI jostle and fight for position by crowding or side-swiping other players.
⍰ Rip it up or get wasted in 1 Player modes (Single Race, Season, Circuit and Practice) or 2 Player modes (Single Race or Circuit) with 4 season difficulty levels: Novice, Semi-Pro, Pro and Expert.

JET MOTO COMPARISON

	Jet Moto 2	Jet Moto 3
Sales (thru 8/99)	1,250,671 units	N/A
Players	1-2	1-2
Bikes	10	11
Tracks	10	19
Magnetic Grapple	Yes	Yes

For web browsning I mostly use the the pc, but imho Okami really is a
very good news/mail program.

>Normally you can format a 720k disk on a PC and it can be written and
>read by the ST, that's what I do under Windoze '98.

And remember to _always_ keep Atari disks write protected when inserted
in a pc. Two reasons:

1. The pc always tries to "correct" the bootsector even I you only read
from the disk (sic!). For some reason my pc has trouble writing to 720
disks. It can read them itself afterwards but other computers can not.
1440 disks works well between pc-MSTe works well though.

2. Long filename entries in the FAT can disturbe some Atari programs.
But only when writing off course.

Hi

I use an HD floppy for regular transfer of data between the PC & ST. I also use 720k to transfer data for the ST's that don't have an HD drive. I always have the disk write ENABLED and have had no real problem.

Using 1.44 disks, I use the PC to format them instead of my ST's. I have come across a minor problem every now and then when I've deleted files from a 1.44 on the ST, so I do a quick format in windoze 98.

I NEVER need to write protect the disks that I use between the 2 machines.

>
>2. Long filename entries in the FAT can disturbe some Atari programs.
\>But only when writing off course.

I try to steer clear of using long filenames, as these can cause phantom files.

ACSI is not terminated. ACSI is just a point-to-point link which goes
from the computer to one device. If that device has an output again,
then you have another point-to-point link there - ACSI is not a bus
like SCSI.

DC Format 3 seems to be a good option to format disks which are
compatible in both platforms (PC/ST). But where can I download it? Can
someone e.mail me a copy?

Also, MagiC looks like a real nice OS. Again, where can I download it?

Finally I found Gemulator Explorer which is a program to read ANY Atari
ST or Macintosh disk on the PC. You gotta try it!

Thanx!

You can purchase it from ASH in Germany or System Solutions in England.
MagiC is commercial software.

I am going to be making this program and a few of the most commonly
asked programs, available for download from my web site.

I will try and get this program zipped and ready for download within 24
hours for you:)

This will be the exact URL: www.steverosie.demon.co.uk/programs/dcform3.zip

I'll get a web page for this section when I can. If you know of other
commonly requested programs, drop me a line and I'll make a note:)

The original keyboard is broken. Please help me, I�m computer enginer and I have a laboratory, but I do not know how make a PC keyboard compatible.

Other interesting questions for the future are how to use a PC diskdrive and mouse.

The falcon is a hard machine, and to repair it is easy (all the components can be purchased, excepts disk drive, keyboard and mouse)

Can somebody help me?

Yes , now the PC specificatios are changed its structure. Now it�s possible
to have problem not only interchanging disks with Atari, you can also have
problems interchanging with old versions disk created with old MSDos
version.

One time more we�ll have to think taht PC is a really shit

News>   Other interesting questions for the future are how to use a PC diskdrive
News> and mouse.

A PC diskdrive can be used out of the box, you only have to set it to
use DS0 instead of the default DS1. Most newer drives have only 0-ohm
SMD resistors instead of jumpers to set drive select, but this should
be no big problem.

For the keyboard you need some kind of converter to change the
protocol - usually using some microcontroller.

Yes , now the PC specificatios are changed its structure. Now it�s possible
to have problem not only interchanging disks with Atari, you can also have
problems interchanging with old versions disk created with old MSDos
version.

One time more we�ll have to think taht PC is a really shit

Perhaps Hushi ought to learn that TOS 2.xx and 3.xx handle up
to 512 MB on their own...

> Currently 3.05 and 3.066 or 3.66 in other TT.

That would be 3.06. There never was 3.66, period.

There once was a MEGA-ST version of the Riebl Ethernet card, but good luck trying to find those nowadays. It features a CheapNet connector and works reasonably well, using MiNT-Net. However, while TCP/IP is available, there is no IPX support.

Last but not least, those Riebl cards cost a fortune....

I want to connect the following equipment. MIDI in's and out's are indicated.

KX88: IN � OUT

Korg M1:   IN � OUT � THRU

ATARI: IN � OUT

The object is use the KX88 as a controller (it has no sounds anyway) for the sounds on the M1, record into the Atari sequencer (Atari has a built in MIDI interface), and play back from the Atari into the M1.

I would also like to be able to hear what I am playing when the Atari is turned off so that I am not forced to listen through the sequencer.

Question: How should I hook this up?

Thanks for your opinion.

a) It's SCSI-Tool, not HuSHI,

b) AS this is a FAQ, partition size limits are both documented in the
HELP menu and the readme files,

c) The maximum partition size under TOS 3.06 is 512 MB -- however you
need the right combination of sector size (which may not be 16384) and
number of sectors.

Hope this helps,

Julian

Going out of my league here: Connect the KX88 MIDI Out to the KorgM1 MIDI In. Connect the Korg M1 MIDI Out (could be thru, however) to the Atari MIDI In. This will accomplish what you want.

> I would also like to be able to hear what I am playing when the Atari is

Simply connect your speakers to the M1 audio out. This way, sound playback is not dependant on the Atari.

> Question: How should I hook this up?

Now I just need a rig like this for myself. There's glory in having to spend 5 hours just to figure out how to wire your setup - it usually means you have a buttload of equipment...;-)

With this setup you will not be able to playback from the Atari program. You will need extra hardware to get the setup you want:

KX88 Out to MIDI Merger In 1
Atari Out to MIDI Merger In 2
MIDI Merger Out to M1 In
M1 Thru to Atari In

Note that with this sort of setup you must turn off the "software Thru" in the Atari program.

>

We are talking about MIDI here, not audio!

>> Question: How should I hook this up?

See above! Actually I would prefer a standard setup without the MIDI Merger. Then you must have the sequencer program running but this also makes channel changes etc much easier when you play the keyboard yourself:

KX88 Out to Atari In
Atari Out to M1 in
 If you want to control KX88 behaviour from the Atari add:
M1 Thru to KX88 In

(Followups trimmed)

I think this should do it,when recording you may need to turn off
something like (local, echo) or whatever it is called in your choice of
sequencer to prevent what you are playing going back to the KX88 and
being sent over and over

hope this helps

Hello,

I'm research source code in C or assembleur for programming the IDE and SCSI bus of a Falcon 030 (and TT for the SCSI). Could you help me ?

Thank's for your answer.
Best regard

Florent

Hello

The asking price for the merchandise below is $175.00 U.S
"Trades will be considered. Iam looking for Synths & Signal Processors"

Iam located in Minneapolis MN.
The shipping cost will be payed by the seller within the 48 contiguous states"

Please E-Mail all enquiries to pdohman@cbsd.com

Terms of payment:

a.On line escrow buyer pays "tradesafe" fee

b.Buyer prepays

I have done my best to provide accurate descriptions. Iam by no means a expert on the Atari platform so please bear with me

The 1040stf is running:
TOS version 1.0
GEM version 0.19
Total RAM 1.05 Megs

The software I have available is as follows:
1.E-Magic Notator SL
version 3.16
2.C-Lab Creator Notator
version 3.1
3.E-Magic fonts & help disk
4.E-Magic Fonts 1
5.C-Lab demo disk
contains SON documents for Kawai, Roland etc..
6.C-Lab font disk
contains 20+ fonts
7.Dr T's
version 1.12 with MPE
8.Dr T's
version 1.1 with MPE
9.Dr T's X-OR profiles disks 1-2-3-4
10.Band in a Box
version 5.0 includes disk 2 & 3 with 50+ styles on each
11.Genwave
version 1.41 Program seems to crossfade algorithms for Korg, Emu, Peavey, Roland
samplers. The dongle for this program inserts in port next to mouse. The dongle shows signs of wear.
12.Genwave
version 2.0 Most of the programs on this disk require color monitors
13.Steinberg synthi works DX/TX
this program would not boot on either drive.
14.Steinberg synthi works DX/TX color
was unable to boot due to monochrome monitor
15.Steinberg synthi works DX/TX sound library
documents appear to be patch libraries.

Once again the hardware I have available is:

1040STF Computer.Comes with Power Cable,Manual and Mouse

Future (Indus) GTS-100, Formats DSDD 720KB. Extends Format to 85 Tracks. Step up from An Atari Disk Drive. Has a 1" Drive Mechanism. Newer & Quieter than Atari Drives and easier to find Drive Mechanism Replacements. You can

also replace the Power Supply with an
Atari 5200 Power Supply. Has a Track
Counter which can show the Track Copy
Protection is on. Cable and Power
Supply included..

SM124 MonoChrome Monitor

Best Regards
Patrick Dohman

I have some work saved on a floppy as .son and .pat files, created in either
Notator or Creator on an Atari ST1040. I no longer have the Atari or the
music programme I used to work with. I urgently need to convert these files
to midi for use on a PC. Is there any programme for converting these or is
there somewhere I could e-mail them for conversion?
Thanks

Lola

I've never seen it for download. Wasn't it commercial ?

Anyway, you can get the Marcel word processor which can read ST Writer
files and convert them to RTF or ASCII. It's freeware on most FTP sites.

MARKKU

HUSHI IS NOT GOOD FOR BIG HD (I HAD SAME PROBLEM WITH MY TT AND 2GB DISC.
WITH NEW HDdriver no problems. You do not need to change TOS

Markku

Get HDDriver (no hushi) your HD is to big for the hushi driver
HDdriver vesion 7.7 is out now. Work perfect for me.
I had same problems with 2GB disc.
Not new TOS needed

The thing is what do you want to do with the STE ?

If you want to play games, and only play games, you need a colour monitor or a TV.

If you want to work with serious applications, and no games, you need a mono monitor.

If you want to do both, then you need both monitors.

Don't go and buy a PC monitor for use with an ST. It can work as a replacement for a mono-monitor if you are able to build (or buy) a special interface but I wouldn't buy one specifically for that purpose. You'd better go and buy a real used Atari monitor. It will be cheaper and give a better display.

Details in the Quick FAQ at http://bales.online.fr/atari

Nick

I would argue this point I'm afraid...I build and sell the vwery small interfaces required to use ST's with SVGA monitors as mono and I personally find them better than most Atari monitors if opnly because they are bigger, as for expense...a S/H ST mono monitor is worth more than a 1040STE in this country, used PC monitors are almost throqwn away....15 UKP buys the converter plug if you don't want to build it yourself.....As for colour, I can build SCART leads or I have aerial leads on the shelf...

Did you have problems with HD Driver on the 2GB disk? I find that the PC won't recognize files after the Falcon has written to to 2 GB drive. I wonder if upgrading to 7.7 will solve the problem

The maximum TOS partition size does not depend on the partition utility or driver. Under TOS 3.06, SCSI-Tool lets you create partitions up to 512 MB (which is the limit for TOS), and HuSHI is able to access them.

I think ST Writer was public domain and, IIRC was written because 1st Word wasn't finished when the first STs were released. Either that or it was written so that the 8-bit users had a compatible WP when they upgraded to the ST.

It was on both the February '91 ST User and ST Format 27 cover-discs
with the ST Format version being STE compatible.

It is possible to connect your MegaST to a 10baseT / 10base2 TCP-IP LAN.
You will need some extra hardware (Riebl card, PAM card or RealTek
adaptor with ROM-port device).
You will also need software. Think STinG will be the best solution in
your case. Once you have STinG configured you can surf on the LAN and
also on the Internet with your ethernet board.

No, I think Atari released it as PD. I certainly saw sevdral versions on magazine cover and similar disks, and PD libraries all had it.

>Anyway, you can get the Marcel word processor which can read ST Writer
>files and convert them to RTF or ASCII. It's freeware on most FTP sites.

True, but in fact unless you want to reproduce the print styles, spacing and paging, you can just print the files out from the desktop, or load them into a text editor and remove the 'Do run run' header and a few high ASCII characters (sometimes followed by a single number or letter) and then print out from the text editor. It's virtually all plain text.

As I can tell all answers so far have addressed main part of the problem. However, there might be a few more thing so check.

1. MMU and GLUE chip contacts oxidisation. Be sure to clean contacts both on chip and on socket. I do it carefully with fine grade nail polisher. It also helps to bend all pins on the socket with needle in order to press on chip pins harder. Check also al corner pins on the chip. Sometimes they come in contact with each other when you insert the chip into socket.

2. Check pin no. 17 (HALT) on the CPU. When you press the RESET button, pins 17 and 18 (RESET) should go low. When you release button, both pins should go high and stay there. If machine finds error in RAM during initialisation, pin 17 (HALT) will go low and stay in that state...

3. If you suspect RAM failure, it usually helps to check it by bank swapping. 1040ST has two banks of RAM (each 1/2 Meg) and with manipulation of just a few wires you can disconnect the second bank and try starting without it or disconnect the first bank, place second bank in its place and try again. But this involves some soldering and perhaps skalpelwork, so you can email me about it if everything else fails.
BTW: If you find error in RAM in this way, it's usually good excuse for making RAM upgrade 4Mb as it would cost you in money and time practically the same...

4. Try reseating TOS chips and everything else in sockets.

Hope this helps,

Branko

Would this temp you? It refers to shipping in the USA.

The time has come for a new owner for the Bear Cavern BBS's equipment.

The following Atari equipment and software are for sale for $500 plus $50 for handling and shipping.

Optional: Will include an APC BackUPs 400 UPS for an additional $40 which will probably only pay for shipping.

1   Atari Mega 4 STe equipt with 50 MB hard drive, Ajax chip, 1.44 floppy drive. With a JinMouse (better than an Atari Mouse).

2   Atari 14" swivel base monochrome monitors.

1   Atari SC1224 color monitor.

1   1.1 Gigabit Seagate SCSI Toad Tower Hard Drive with Adaptic card.
    Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
    This hard drive is the one used with the BBS and contains several hundred Atari, MSDOS and Windows files.

1   540 MB Quantum hard drive with an ICD II adapter.
    Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
    Built in the same box, a 750 kb floppy drive. The floppy is good but the cord length makes it unreliable. Best to remove it and use it as intended.

The BBS software is BB/ST by Quantum Microsystems. Old but reliable.
The program has been improved by Anthony Watson (Mountain Software), improving the file library and the File attached Mail.

Maintenance software on the BBS includes, Diamond Edge, Diamond Back, ICD Pro Utilities, SCSIWAIT 3.

Two external SupraFAXmodems, 1 v32.bis and the other 33.6 (these are the ones with the display)

Dozens, if not hundreds of 750 kb disks with commercial software, Magazine files, and STReports downloads and manuals. (Also the Best Electronics catalog).

Cords, powered monitor switch (will switch from one monitor to another including the AC)

Mega STe Field Manual

Lots of software

Yes, I think this is the only thing left to try. It does prevent a lot of
cabling difficulties though... :(

I have a whole crap load of atari tech manuals, You know the real good ones
that show part numbers and stuff like that.. There is practially every atari

component here. 1050 drives, 400,800 xl xe's ST's monitors. All in very good shape, and I'd say the whole lot weighs about 10 lbs (around 2000-3000 sheets). The first person to email me wins the deal for the measly cost of shipping it to you. I have no need for these, and a friend gave them to me who was into that, and upgrading and things. If you would like to see them first. I could scan a few pages, and post them.. If you only interested in a certain manual, I'll see if it's here. These are NOT the manuals that came with the components, but Scamatics and such on how to reapair them.. Worth hundreds of dollars to someone into Atari Upgrading or Repairing. Your's for The cost of Shipping (around $15-$20.00 US).

I have the following for sale in the UK preferably:

STE 020/68000 switchable, with 6 meg (2 meg Fast RAM), with TOS 2.06, a 56k serial port, battery backed clock. With the 68020 processor and Fast RAM, this computer is faster for raw processor power than a Falcon 030 (everything except FPU, DSP and specialized Falcon functions)

Epson Stylus Colour 200 printer

Protar 40mb Hard Drive (One of the solid German slabs that you can sit the monitor on.)

High res. monitor

Pagestream, Calligrapher, Imagecopy, Diamond Back / Edge, Speedo GDOS and LOTS more disks.

Mail me and make an offer for the lot. May split, or swap for ST Book :)

Great setup, used it for years, hardly any problems. Ideal for GFA basic (what I ran on it for years :)

I 'd like to connect my Mega STe to my TT, and vice versa using a
LAN-connection, the serial ports or the modem ports. I've already tried the
MIDI-ports with the DUET program. It works OK, but it's a bit too slow.
I'd like to read data from one HD to the other and vice versa and use the
same printer.
Can anyone suggest cheap/good/reliable programs and/or connections?
Are the cables (LAN, serial, modem) readily available?
Any suggestion or help is welcome!
Thanks!

HDDRIVER supports IDE and SCSI drives of any size. Tests have already
been run with 23 GByte drives but even larger drives are no problem
since it makes no difference for HDDRIVER.

It won't since HDDRIVER is not responsible for writing files. Files are
written by GEMDOS and HDDRIVER doesn't influence any GEMDOS action.

Hi,

I'm writing a routine to load a PI1 file in VB (eaugh!) on a PC(aaahh!), so I can put screenshots of my old games on my website. I can load the palette information correct, then next is the screen information.

What I can remember is each byte is two nibbles(4 bits) - the high one gives the colour (palette index) of one (even numbered) pixel, the low nibble gives the colour of the next (odd numbered) pixel. Yet when I run my code, it looks like I've tried to load the picture in the wrong resolution! (black vertical stripes & distorted graphics)

Now is this anything to do with the fact the atari & PC stores bytes the in different ways (big & little endian) - I dont know if they do, but I should imagine it would cause a problem anyway!

Or is it anything to do with something not being aligned on a word boundary (erk - faint memories of atari programming!)

Please let me know if you can help!

Cheers,
Simon.

Here is a snippet of code (in VB - should make sense!) I'm using to display the image:

```
    nCCount = 1
    For nYLoop = 0 To 199
        For nXLoop = 0 To 319 Step 2
            nCPointer = Asc(Mid(strImage, nCCount, 1)) And 15
            imgScreen.PSet (nXLoop + 1, nYLoop), RGB(nPalette(nCPointer, 0),
nPalette(nCPointer, 1), nPalette(nCPointer, 2))
            nCPointer = (Asc(Mid(strImage, nCCount, 1)) And 240) / 16
            imgScreen.PSet (nXLoop, nYLoop), RGB(nPalette(nCPointer, 0),
nPalette(nCPointer, 1), nPalette(nCPointer, 2))
            nCCount = nCCount + 1
        Next
    Next
```

Hi!

In article <7rvm8p$p84$1@nnrp1.deja.com>,
reschke@muenster.de writes:
> 512 MB (which is the limit for TOS)

The limit for TT-TOS, Falcon-TOS and MagiC can access partitions up to 1 Gig (32766 clusters with 32768 bytes each). Using larger partitions (up to 2 Gig) only seems to work fine with TOS 4.0x, but it's not recommended as there are problems in TOS which may cause serious problems.

Ciao

Thomas

I`ve just got a Falcon to add to my Atari collection and I`am after some extra memory as its only got 4meg.
Can anyone tell me how to wire up for a SVGA monitor.
Whats LAN & DSP ports for?
How can I connect the STe to the Falcon to transfere files or software, + what software to run?
Any other pointers for the Falcon would be helpfull.

Thanks..

Karl

> recommended as there are problems in TOS which may cause serious
> problems.

No, TOS < 4.0x only supports a maximum partition size of 512 MByte.

There are plans for a cable in the Quick FAQ. You could also buy them
from an Atari dealer if there is one in your part of the world.

> Whats LAN & DSP ports for?

LAN is an AppleTalk compatible serial port. You can use it just like any
serial port up to 115Kbps with a Mac modem for instance.
DSP is a direct connection to the DSP chip. It's used mostly for audio
applications (multiple audio in/outs, S/PDIF, etc...)

> How can I connect the STe to the Falcon to transfere files or
> software, + what software to run?

Null modem cable or Midi and terminal emulation with Duet. STinG might
be a solution, but difficult to setup. The fastest will probably be good
old PARCP, which requires a custom built cable, but works between all
combinations of PCs (DOS or Linux) and Ataris. Funnily enough, there are
more ways to connect an Atari to a PC than to connect Ataris between
themselves.

> Any other pointers for the Falcon would be helpfull.

The temporary address for the Quick FAQ is at:
http://bales.online.fr/atari

>> MegaST to these Networks?

If you want a quick, farily easy, and no extra cost solution...
Just Link the ST to a PC box via the serial port with a NULL modem
cable and set up some sort of IP mask on the PC. SLOW indeed, but it
works.

STing would allow you to set up a PPP/Slip/Cslip connection into the
LAN. There are clients and servers for STing for FTP and HTTP.

On the client side, there are also html browsers, email, news, icq,
irc, finger, telnet, and others for STing.

If mounting drives is an issue...
Wether you use an ethernet solution, or a simple serial connection,
there are basicaly two choices I know of. One being a Mint setup on
the Atari with moutable drivers (NFS? I forget what it's called),
also on a PC somewhere in the LAN...or, to run a TOS emulator
somewhere in the lan, and go thru BNET for STING.

Brian

A PI1 has the format

1*word (usually 00 to indicate low rez)
16*word for the palette
32000 byes for the picture data

The low rez screen is in words for each plane.
1st word = plane 1
2nd word = plane 2
3rd word = plane 3
4th word = plane 4

the 5th word is the next word across the screen (screen base + 8).
This sequence carries on until the screen is filled.

I had the same problem with this drive. I tried lots of different driver
software, and was only able to get the ICD driver to recognize it, and
even then it only worked if I booted from floppy, I couln't get it to
boot off the hard drive. Likewise, it worked fine on the Falcon. I think
this may be because TT is SCSI I and Falcon is SCSI II.

TT is SCSI-2 like the Falcon and SCSI-3 also works because it's upwards
compatible. Don't confuse connectors and software standards here. It's
no problem at all to connect SCSI-2/SCSI-3 devices to ST, TT, Falcon.

You can't boot from the Quantum Empire 1080S because most firmware
versions of this drive require initiator identification which is not
provided by TOS. HDDRIVER definitely works with this drive. I used it
with my TT for some time. HuSHI and CBHD will also work since they also
support initiator identification.

Yes, you also implied that TOS 3.xx (a.k.a. TT-TOS) supports 1 GB.
This is not true.

I've just taken an Atari MegaST into custody.
After having chipped out the old batteries, I can't reset the internal
real time clock. I understand that I need the 'desktop aceessories
disk' to do the job, via a 'control panel'. Does anyone have one of
these disks or a copy?

The old CONTROL.ACC was replaced later by XCONTROL.

You can get XCONTROL from the Quick FAQ at
http://bales.online.fr/atari

This is one of the pi1 formats.

Degas Elite format saves files of 32066 bytes in size, because they
contain palette animation.
So
1*word (00 low rez, 01 mid rez, 02 high rez)
16*word palette
16*word palette animation
32000 bytes picture data.

A small hint... try run some picture conversion program on your st,
like picfib or Gemview. You can make a batch, generating all the .gif
you need.

I assume you have the full manual and quick start book, if not give me a
yell and I'll find what I can.

Bob King.

I have now downloaded the accessory disk files via
http:\\bales.online.fr\atari.
Of course, to do this, the target disk was ms-dos formatted, and as we
know, ms-dos disks cannot be recognised by Atari. So how do I transfer
the files from ms-dos disk to atari-disk?

If you used DD disks, then MS-DOS discs can be read by an Atari, it's
the other way round that's the problem. If you used HD disks then that's
another story. Format the PC disk with FORMAT A:/T:80 /N:9 to get 720
Kb.

Hi!

In article <37E87D14.1DE3@ooc.de>,
Uwe Seimet <us@ooc.de> writes:
> Yes, you did:

No, I didn't. You just got my answer wrong (OK, a semicolon instead of the comma would have maybe avoided the confusion, though you should have easily noticed that the sentence isn't correct, otherwise):

>>> The limit for TT-TOS, Falcon-TOS and MagiC can access partitions up to 1
>>> Gig (32766 clusters with 32768 bytes each).

The first part of the sentence ("The limit for TT-TOS") was the reply to Julian's "512 MB (which is the limit for TOS)", i.e. that this limit is only valid for TT-TOS. The rest of the sentence is further explanation for this, i.e. that Falcon-TOS and MagiC can use 1 Gig partitions.

Clear now?

Ciao

Thomas

The atari should very well be able to read MS-DOS formatted disks as
long as:
-they are formatted as 720K disks on the PC under DOS
-they are REAL double density disks, not HD with tape over the hole.
-the ST is equipped with a 720K double sided drive
-you do not use VFAT filenames or folders (best to copy the files over
under DOS too)

With all of the above, it *should* work. But then you sometimes have
some very fussy drives.

Nick

I used to use Pagestream to create Postscript files to print them with the Ultrascript driver for the SLM 804 printer. You need to install the Softlogic Postscript screen fonts package. This has the basic 35 fonts for basic Postscript such as found in Ultrascript or a basic Postscript compatible printer. (It also requires deleting the Times and Helvetica fonts from the Pagestream fonts folder). I believe SoftLogik also provided .PS files for downloading their own fonts to Postscript printers, but I would stay away from standard stuff after reading Dave Troy's troubles getting his service bureau to print his postscript files.

I wouldn't recommend running either on only 1-meg, as I've encountered consistant crashes doing so.

Subjectively, Cubase is much more straightforward in terms of productivity, while Logic allows greater flexibility with midi. Essentially, Logic is Cubase with way more capabilities and a modern UI. I still prefer Cubase's simplicity though.

Of any Cubase, I would suggest Cubase Audio (Falcon or CBX) as this software can run on non-Falcon and non-CBX-equipped Ataris with the audio capabilities disabled. Also, Cubase Audio Falcon has RAM-tracks which allow one-shot sampling (which can also be triggered via midi) and small audio parts to be played from RAM. Also, note that syncing Cubase Audio (Falcon or CBX) to SMPTE is only possible via SMP-24, as Cubase crashes when Midex+ is used. However, Midex+ is fine for syncing Cubase Score (non-audio) to SMPTE.

*** Note that it is possible to use Steinberg's Macintosh Micro Midi Interface with the Falcon's LAN port, providing an additional midi in and out. ***

Perhaps you should investigate Notator as well, as this program has probably the lowest overhead of any modern sequencer, thus its apparent speed, and it should run fine on a 1-meg Atari.

Unfortunately, I find running one sequencer alone is not enough. My main system consists of:

Cubase Audio CBX/Score (TT030)
    -midi & digital audio
    -midex+
    -SMP-24
    -5 midi in total
    -9 midi out total

I also run these, which feed/are fed from Cubase Audio CBX

Cubase Audio Falcon (Falcon)
    -samples, additional midi generation
    -SMP-24
    -micro midi interface

Notator Logic 2.5 (Mega4STe)
    -midi automation, sound editing, and midi generation
    -Unitor2
    -Log3

-SteadyEye
-Combiner

Sorry for the long message!

res

Bonjour,

That question is really asking to pick a fight. But for the 1040, Notator SL is said to have a better user interface. Apparently in Notator Logic became more Cubase-like, but Notator SL is the classic interface that so many swear by. Check:

http://members.forfree.at/~notator/

MagiC does NOT support TOS compatible partitions > 1 GByte. I asked
Andreas Kromke about it and he said that 1 GByte is the maximum
partition size.

OK, I stand corrected.

One thing that is becoming obvious though, is that TOS 2/3 really should be patched with a newer GEMDOS (or was the limitation from BIOS/XBIOS, I forgot?) like the Falcon.

Improvements needed for TOS 2/3:

* partitions up to 1 GB
* up to 32 drives (increase the letters over P, up to A-Z,1-6)
* AES 3.40

Wasn't Milan Computer supposed to release improved TOS 2/3 for upgrade? We definitely could use some TOS 2.07 and 3.07 upgrade roms that include the above fixes.

The partition size especially is becoming a problem, as current drives on the market are 200 times the size of the good old ST157 and we need to be able to use them, without resorting to a ridiculously fragmented drive of 16 partitions, just to accomodate the current 512 MB headroom.

That may (or may not) depend on the source and target formats. The conversion, should it need applying, is simple provided you are dealing with whole word and longwords. (ie if you want a real headache try and deal with 12 bit FAT's as used by floppies).

16 bit word: exchange hi and lo bytes (eg $1234 -> $3412). Job done.

32 bit longword: exchange ho and lo words, then do word conversion on each word (eg $12345678 -> $78563412).

To clarify:
$1234 5678
$5678 1234 <- word exchange
$7856 3412 <- byte exchange on each word.

> Or is it anything to do with something not being aligned on a word boundary (erk - faint memories of atari programming!)

> Please let me know if you can help!

From "picfmt.doc" on (iirc) umich...
<<PICFMT.DOC>>...

<DEGAS>	*.PI1 (low resolution) *.PI2 (medium resolution) *.PI3 (high resolution)

1 word	resolution (0 = low res, 1 = medium res, 2 = high res) Other bits may be used in the future; use a simple bit test rather than checking for specific word values.
16 words	palette
16000 words	picture data (screen memory)

32034 bytes	total

<DEGAS Elite>	*.PI1 (low resolution) *.PI2 (medium resolution)

*.PI3 (high resolution)

1 word	resolution (0 = low res, 1 = medium res, 2 = high res) Other bits may be used in the future; use a simple bit test rather than checking for specific word values.
16 words	palette
16000 words	picture data (screen memory)
4 words	left color animtion limit table (starting color numbers)
4 words	right color animation limit table (ending color numbers)
4 words	animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words	128 - animation channel delay in 1/60's of a second. [0 - 128] (I.e., subtract word from 128 to get 1/60th's of a second.)

32066 bytes	total

<DEGAS Elite (Compressed)> *.PC1 (low resolution)
*.PC2 (medium resolution)
*.PC3 (high resolution)

1 word	resolution (same as Degas, but high order bit is set; i.e., hex 8000 = low res, hex 8001 = medium res, hex 8002 = high res). Other bits may be used in the future; use a simple bit test rather than checking for specific word values.
16 words	palette
< 32000 bytes	control/data bytes
4 words	left color animation limit table (starting color numbers)
4 words	right color animation limit table (ending color numbers)
4 words	animation channel direction flag [0 = left, 1 = off, 2 = right]
4 words	128 - animation channel delay in 1/60's of a second. [0 - 128] (I.e., subtract word from 128 to get 1/60th's of a second.)

< 32066 bytes	total

Compression Scheme:

PackBits compression is used (see below). Each scan line is compressed separately; i.e., all data for a given scan line appears before any data for the next scan line. The scan lines are specified from top to bottom

(i.e., 0 is first). For each scan line, all the data for a given bit
plane
appears before any data for the next higher order bit plane. Note
that this
is identical to the IFF 'BODY' image data.
To clarify: The first data in the file will be the data for the
lowest
order bit plane of scan line zero, followed by the data for the next
higher
order bit plane of scan line zero, etc., until all bit planes have
been
specified for scan line zero. The next data in the file will be the
data
for the lowest order bit plane of scan line one, followed by the data
for
the next higher order bit plane of scan line one, etc., until all bit
planes
have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on
compressed DEGAS files:

- o Elite uses a 40-byte buffer to store data being
decompressed.

- o Whenever a control command is encountered, bytes are stuffed
in this buffer.

- o The buffer is only emptied when there are EXACTLY 40
characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40
bytes in it. In other words, all control commands must end on
or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus
error when the picture is loaded.

...<</PICFMT.DOC>>

eek! Basic! run away - run away! :-)

Looks something like you're drawing directly on a canvas above (I dunno any VB btw). Have you considered a direct file conversion? I had a quick peek at the Win95 programmer's docs. A direct conversion doesn't seem wholly impossible. These datatypes are worth perusing...

TM> Can anyone tell Me the individual dip switch functions on the MSTe
TM> hard drive controller board?

Here is a copy of a message that I saved some years ago written by Sid Celery of the UK Association of Atari User Groups.

Area: A.ATARI.TECH
From: Harry Sideras
  To: Darren Trutzenbach

Hard Disk Drive: Must be set to ID 0. Any other ID will not be recognized by the Atari host adapter board (at all, ever).

Host Adapter: Three DIP switches exist on a red block on the board. The word 'ON' is printed on the front right of it as you look from the keyboard side of the machine. The DIP switches are marked 3, 2 and 1 (from left to right). All the DIP switches should point to the front of the board (ON) so that the board maps the SCSI ID to zero.

Flick the DIP switch marked 3 away from the front of the board and reboot. The internal drive will be remapped to SCSI ID 1. Return DIP switch 3 to the original position and flick switch 2 away from the front. Reboot and the drive will be ID 2. IF both 2 and 3 are flicked away from the ON position and you reboot, the drive will be remapped to SCSI ID 3. This is the maximum ID number available with the Atari host adapter board.

I don't know what the DIP switch marked 1 is for because it doesn't affect the SCSI ID number in my tests. However, I did hear once that it's related to running a second SCSI device from the internal host adapter. But, you need to remember that the power supply of the Mega STe is unlikely to be able to power a second drive, so I'd find out much more before I tried this.

Regards, Sid Celery UK Association of Atari User Groiups

As most people are already either using MagiC or MiNT+some AES, I don't
think it's that necessary. Furthermore, Big-DOS already offers the first
two enhancements for Single TOS users.

Ciao

Thomas

Newsgroups: comp.sys.atari.st.tech

I have a 1040st that I have been fighting to get up and running w/Cubase for the last year and a half. Right now we have a crack version that came w/it when I bought it. It is not stable. I would love to get the real deal. Does anyone have it for sale or nostalgic gift?

One moe quest..
I got another version of Cubase in my email. do I have to have low density discs or will other (HD DD) work if formatted properly. Where can I get LD discs?

I have tried to download other Atari software from PC before, to no avail. It hasn't worked for me. What's the best way to download a file fron PC for atari.
(so I can use it)

Thanx in advance...
tracy

This doesn't make TOS see the extra partitions at bootup, nor does
it allow partitioning up to 1 GB. Sorry, it's no substitute for a
newer TOS version.

Hi

I have a Mega STE, you probably figured that one out:), how do I install
and internal hard drive? it has an Ethernet card fitted...

and how do I get the thing to go above the 19,200 baud rate on serial 2?

thanks in advance

```

Dip switches 2 and 3 on the host adapter board are to change the SCSI
ID number. It goes as follows:

2	3	ID
ON	ON	0
ON	OFF	1
OFF	ON	2
OFF	OFF	3

Jumpers on your HD drive must be set to ID=0.

Dip switch 1 is set to ON at me but I don't know what is its function.

Hi Tracy,

Firstly, I think it is right to point out that using cracked/pirated versions of software that are, or are not, currently in commercial production on the Atari or any other platform is an infringement of copyright which is punishable by international law. Many people justifiably also consider this to be totally immoral.

A full version of cubase for the Atari is available from many vendors - try System solutions. Don't expect it for the price of a gift though.

http://www.system-solutions.co.uk/cafe

To transfer files from your PC to Atari - format a double density disk on the PC, copy the files onto the disk, and your Atari should be able to read them. Older versions of TOS may not be so willing - Sorry.

The main reason that your cracked version of cubase crashes, is, that the cracked versions rely on a piece of software to replace the hardware dongle that should be placed in the cartridge port. Rather like emulators - which try to replace processors with code - they work, but only to a certain extent.

Then, obviously, some other app is trying to override the baudrate
you have set in SERIAL.CPX and STinG. Your old MODEM.CPX wouldn't
be still enabled, would it? Also, check DEFAULT.CFG and DIAL.SCR,
in STinG's configurations.

Aloha,

I've a freshly installed CT2...
For the most part it behaves very well, but I've some trouble
shooting to do...mainly around the SCSI array.

Where do I start?

First, I'll describe my problems...

Note, in normal mode, using HD-Driver 7, I can thrash my SCSI array to pieces with no problems. I can load CAF to the max with several audio tracks all fragemented, and just go to town...may a scsi Lock up once in a blue moon (that resets after a few seconds by itself with no error messages or anything).

Also, I try to use Cecile in normal mode, I get problems...Esp with CAF. Also, MajiC 6 won't boot at all with Cecile in normal mode, but it will boot in turbo mode ONLY If I boot from floppy and do a million and seven warm starts, and hold my mouth JUST right...and PRAY. Still, CentScreen won't work.

So, CAF and MajiC 6 aside, My Falcon is very stable...in normal and Turbo modes.

CAF acts very strange in turbo mode with Cecile!
Yes...I followed the Docs to the letter, and installed the patched MROS. Basicaly, every few seconds when playing or recording audio, the SCSI bus locks, my entire hard disk array flashes and cuts up, I get a SCSI error message, one of the following:
SCSI 2 error
SCSI 4 error
Check Connections, ID, and termination.

ExtendDOS Gold 3.2 works fine on the Data access end of things. However, if I use the Audio utilities to play an audio CD, the SCSI array resets itself sometimes...also, cue up something on drive P for example, seems to also try to do the same thing on drive O. None of this happens in NORMAL mode. Also, when ripping audio, I get SCSI bus lock ups.

Nova Scan...
The SCSI bus locks up, and my Scanner light flashes as if hung with the light bar in mid scan.

Now...all this is odd!
I've done many tests...copying files and running Cecile_Tools.
Even grabbed about 80 meg of files from one physical disk and copied it to another. It was FAST AS HELL...drives going nuts! BUT NO time outs or lock ups.

At any rate...
Is there anything I can try that might help?
What are the BEST settings for the hard disk array in combo with a CT2? (all the docs for Cecile are in French, and I don't really understand the program very well...what different parts of it do, etc...I.E. what is cecile.prg in the driver folder? When, where, why would I use that?).

Should I have parity enabled or disabled?
Should I set the drives to get termination power from the HOST? From

themselves? Should any of the drives supply TERM power?

At this time I have them set up as SO:

SCSI 0: ST11200D (Seagate Hawk I)
    Parity On
    Termination power from drive...set NOT to supply any term power.
SCSI 1: Chinon 2X CD-ROM (Disabled for now, to keep shortest cables)
SCSI 2: Toshiba 4X CD-ROM (Disabled for now, same as above)
SCSI 4: ST32550N (Seagate 2.5 Barracuda)
    Parity On
    TERMINATION power from DRIVE...set NOT to supply any term power.
SCSI 6: Mustek 1200SP Flat Bed Scanner (Disabled for now)
SCSI 7: Falcon

Once again...ALL this stuff in a LONG chain works very well with HD-Driver 7 in normal mode.

At this time...I only have one external chassis connected, it has the two hard disks in it, Id's 0 and 1 respectively. I use an external termination block at the end of the chain (I've also tried getting rid of this and enableing termination on the LAST drive instead, no change). I checked the connections and tested the cables with a meter.

Really, is Cecile just a piece of junk when it comes to SCSI only arrays?

Maybe I need to check some wires? (Which ones?) Replace something with better sheilded wire (I see two wires that wind under the floppy, they have BLACK TAPE in the middle of them! Maybe noise is the problem? Why only with CuBase and ExtenDOS audio utilities? Even Studio SON works with no problems! As do various other HD audio trackers.

Oh well...
Any Ideas...I'd love to hear them.

Thanks,
Brian

Odd. I thought that monodetect signal goes straight to MFP chip without any complications. Are you sure that this optocoupler is not intended for MIDI connection?
I know that there is one for MIDI and it had 013-something in marking and I remember having troubles with replacing it, as ordinary optocuplers of that time (6 years ago) were not fast enough...

Give that signal closer look. I think that it goes to MFP and it probably has a pull-up resistor (resistor between +5V and the signal). It might be that burned pin driver on MFP is shorting the signal...

One more thing/ check the glue chip. It generates HSync which on some ST's goes straight to the monitor without any buffering. Since MSI chhips are more sensitive to overvoltages then LSIs it might well be that monitor burned it too. If HSync signal is buffered, then you have luck and you will probably have to replace simple TTL buffer....

Hope this helps,

Branko

On Sun, 26 Sep 1999 at 23:40:08 a message from Martin-Eric Racine was
created on the subject of Mega STE: How do I? twice:).
>Then, obviously, some other app is trying to override the baudrate
>you have set in SERIAL.CPX and STinG. Your old MODEM.CPX wouldn't
>be still enabled, would it? Also, check DEFAULT.CFG and DIAL.SCR,
>in STinG's configurations.

I used to use an STE with HD drive, serial mod etc... This is now my back-up machine just in case the unthinkable happens:)

When I moved over to the MSTE the only thing I've done was to adjust and change the port settings!!! I will rebuild the entire software/hard drive as soon as I can, maybe there's a rogue program that's responsible.

I did encounter a small problem on my tower STE using certain programs, like Harlekin II with the higher port speed (28,800 my speed). They caused bad and unreliable transmissions, so these programs are not active/running on the MSTE.

```

Sorry, you have to look at for sale ads, or used music gear shops,
etc...

Not LD, but DD disks, double density.

You can try sticking tape over the HD detection hole on HD disks, but
this is not reliable as a long term solution.

In any case, the disk has to be formatted to 720K on the PC in order to
be used by both machines.

Mono detect pin is only connected by an SM124 to -GND- not other..
Exact: If you connect an SM124 mono detect is connected to GND.

Connect to +12 or +5V blasts the machine.

> I have traced this signal back to a 6-pin DIL called K8013P. From the look
> of it I would guess it is an opto-isolator, can anyone confirm?

Witch? Monodetect?

Sorry, co circiut diagram from any mega here.., but..

mono detect comes from the monitor port pin 4 and follows his track to
R28 (4K7) (open end of R28 to +5) track follows to MFP pin 29 (I/O 7)

That�s what i knwo from a mega..
But mega sts are different.

Regards, Robert

Absolutely correct, it depends on the SCSI-interface and driver. The
interface is Mega STEs and STacys (they're identical) can't handle this.
AFAIK you need a Link 97 or something similar.

All of the above is correct. It fits the descriptions Peter gave me of his
ST modifications.

>All nice and easy? Not quite. Your shifter chip, which makes the picture,
>will run faster as well and this will result in a distorted picture.
>One remedy is a sequencer with tables in an EPROM which restores everything
>to "normal" on the screen. This will also open up a possibility for an
>extended (overscanned) graphics mode, like URA:s Lacescan.

Peter has described using his ST with 960 pixels width on an SM124 monitor.
As the pixel rate was 48 MHz, this still only used 20 microseconds of the
28 available with normal SM124 timing, so additional overscan is possible.

>Another way is to have a separate graphics card.
>
But that is not so easily done with a normal ST anyway.

>The matter of 68010 is that it really speeds up some things, but V-E-R-Y marginally. You must have a TOS 2.06 to be able to use a 68010.

There are also some marginal slowdowns with a 68010 for some things, so I think it is mostly a loss, as there are also incompatibilities. The only real gain is that 68010 is supposed to allow virtual memory to be supported, though I doubt there are any implementations of this for it on TOS machines.

>The only really sensible solution to get a faster ST is to buy a speedup board.

I don't know about that. a good 16MHz speeder with cache will only give a speedup of appx 80%, and no other improvements at all, but Peter's patches gave an overall speedup of 50%, plus a 50% increase in horizontal resolution. All for a very low price. Just an oscillator, a few 74HC chips, and some work.

I think some users would find the improved rez quite valuable, especially if combined with overscan for an overall resolution of, say, 1024x480, which is definitely possible. But it would take a new LaceScan driver to adapt TOS for such resolutions.

>Or even better a new computer, like the Milan or Hades.

That certainly makes a big difference, but at a considerable cost.

>By the way, Hades? Medusa? Who came up with these "cute" names?

I think Medusa was first, probably named so because it made other TOS computers seem petrified when you looked at it.

Hades was probably just inspired by Medusa. Actually a bad choice, as the greek god Hades (after whom his domain was named) was not much for showing any speed, though he was one of the three 'biggies' that killed off Cronos and founded the new world order (with Zeus and Poseidon).

>What's next, an Anticrist with quadruple 68060:s?

You're off on a wrong turning here Martin. Medusa was a *bad* customer, sure, but Hades was not so considered. He just ruled the underworld, but that wasn't the same as hell, and he didn't punish anyone for the fun of it. He was just part of the administration so to speak, and had to obey fate as did all the greek gods. And his fate was to do that job, and do it fairly. He was still considered a god, and a good one, and respected as such.

This is really quite similar to nordic mythology, except that the gallery of gods and goddesses is entirely different. Hel ruled over Hel, but was not considered a bad person even though that was a very bad place.

It is only in a few of the worlds religions that devil(s) were supposed to
have power enough to rule over humans, and be allowed to do so by the god(s).
By any real logic, in a progression from Medusa to Hades, the next step should
be someone really positive. (Hades was a bit dour after all. ;-)

Ok, ok, I know this is off-topic, so I'll stop now.

>
>This is in the Quick FAQ

Correction:

TOS computers do not have built-in support for Ethernet, but it can be added
by expansion boards, which can then be driven by TCP/IP stack software. Both
MintNet and STinG drivers exist for this purpose. Some boards can only be
mounted in TT030 and MegaSTe computers, but on other computers such as ST/STe
and Falcon it is possible to connect so called 'Ethernet pocket adapters'
(really intended for PC printer ports), through an adapter on the cartridge

port of the ST/STe/Falcon. Such stuff is currently being beta-tested for STinG with great success. MintNet drivers will surely follow soon after when the schematics are published.

NB: I am not the one doing this development, so don't ask me for the stuff
    yet. For the present I am just waiting for it myself.

For those not having any Ethernet expansion hardware (like myself), serial null-modem connections are the normal way to implement local networks with PCs. For local networks between ST and STe machines, MIDI ports are a better choice, as they give higher speed than the Modem 1 port, unless that has been modified to raise its speed.

Btw:
This stuff should also be put in the Quick FAQ I think, and updated as new developments occur (as they surely will).

OKAY!

Found out that the old SCSI CD ROM ws a parity one, the NEC CDR-210P. So I
now have an Adaptec 4000/4070.

The ICD boot check does find the CD ROM, I have it now at ID 4. So does ID
Check.

But, now extendos doesn't even see it! :(

Where can I get driver software that will work with the ICD adSCSI ST Plus?

Thanks for the help!

Jim

Is it just a matter of setting up the VDI correctly? If so, I would
assume that you could easily adapt the Lacescan-driver for this.

the
> 28 available with normal SM124 timing, so additional overscan is
possible.

I already have Lacescan in my Mega (I actually never use this machine,
I just like to have something to hack on...), it would be interesting
to stretch things even further by accelerating the bus...

> I don't know about that. a good 16MHz speeder with cache will only
give a
> speedup of appx 80%, and no other improvements at all, but Peter's
patches
> gave an overall speedup of 50%, plus a 50% increase in horizontal
resolution.

What about combining these? A 12MHz ST with a 24MHz ADspeed...

> All for a very low price. Just an oscillator, a few 74HC chips, and
some work.

...and some software to fix up the screen I guess.

It would be *very* nice if you or Peter could write down some details
about this, and perhaps release the software or atleast some source-
code to help us lesser hackers ;-)

Hi

Any good FTP site or PD library should be able to supply you with ADHI,
Atari's hard disk driver. Or you can purchase the excellent HDdriver.

Why not contact Core Design about your interest of making drivers
for a ethernet card for the Eclipse? As the Eclipse will be available
for the TT later on it will be a good thing for TT owners as well and
it might also be possible to use the Eclipse with the ST if there is
enough interest in this.

If noone asks them about this they wont know that people wants it
and therefor it will never turn up.

It was in a series of articles in one of the German magazines, I have some
details somewhere. As far as I remember, the original author did the work on
the older STM machine. The newer machines might be able to make it to 16 MHz.

I intend to try this over the Winter, when I'll have more time.

I did the 12 MHz modification, it worked & averything was 50% faster.

I did not build the Eprom sequencer for the new video resolutions, so I could not really use it with the SM124 for very long. (I guess I could fix the SM124 to work also, but since I have two STFM's, I want to keep it normal for now).

It should also be possible to run the CPU faster, I run my STFM CPU @ 16 MHz when not accessing the bus, I need to find some CMOS 68000, these are supposedly able to go much higher (> 40 MHz).

I guess an ST, with the bus @ 16 MHz, the cpu @ 32 MHz, while not costing much to do would be of interest to hardware hackers. Perhaps it does not have the best performance, but it's a lot of fun to update the ST hardware & see the old applications run much faster.

Great for MiNT.

Was'nt there some video board expansions for the ST, which used standard PC video cards. I remember one design which practically built an ISA slot into an ST. The hardware interface is not difficult, & the ST bus speed (8 MHz) is in the acceptable range for ISA cards.

PCI, well it's much faster, & there are lots of cards available, I think it runs @ 33 MHz, but that might not be important for ethernet cards.
Also, the ISA slot is very simple in terms of hardware support, PCI is more

complicated.

Main problem with PCI is that the hardware costs are significant, and the software aint fun either....ISA needs like a handful of off-the-shelf standard logic chips to get you on the bus and it's a lot simpler.../.You wilkl spend more time being able to deal with board-specific drivers rather than general PCI bus issues....Although PC's may be killing off ISA, there will be vast numbers of ethernet boards around for a long time yet....a lot of places are only wired for 10-base 2 or 10-base T so they don't need PCI=-based adapters...but as they upgrade there will be loads of ISA boards available..

I think you will need a separate driver for the CD, such as SPIN! or Extendos etc. as the ICD driver only works with hard drives - including interchangeables (I am using an AdSCSI with a SyQuest 44 besides a normal HD).

Does anyone know how to do this? I have the pinouts and it almost works but not quite. My screen appears to be split in half with the left half showing on the right side and the right half showing on the left side and each half overlapping each other. Anyone why it's doing that and how I can fix it.

Thanks,
Mark Danley

Take DOIT_ST and have a look to the colorised schematics on video section. Wrong connections may damage the display.

Sounds a bit like the Quick FAQ... or what it was intended to be when it
started!

FYI, a not-quite-up-to-date copy of the Quick FAQ is available at
http://bales.online.fr/atari while the quickfaq.atari.org site is down
(atari.org is partially up, except for the locally hosted web pages).

No I'm not adventurous, I just want to have a place where the most
common requested files can be found in one place.

Ronald Andersson skrev i meddelandet <37cf3e4a58f6e50@oden.se>...

>Hades was probably just inspired by Medusa. Actually a bad choice, as
>the greek god Hades (after whom his domain was named) was not much for
>showing any speed, though he was one of the three 'biggies' that killed
>off Cronos and founded the new world order (with Zeus and Poseidon).

I always connected the name Hades to the "kingdom of the dead" and not the person Hades. As I recall it there were much more references to the place Hades than to the person Hades in the old stories.

>>What's next, an Anticrist with quadruple 68060:s?
>
>You're off on a wrong turning here Martin. Medusa was a *bad* customer,
>sure, but Hades was not so considered. He just ruled the underworld, but
>that wasn't the same as hell, and he didn't punish anyone for the fun of
it.
>He was just part of the administration so to speak, and had to obey fate as
>did all the greek gods. And his fate was to do that job, and do it fairly.
>He was still considered a god, and a good one, and respected as such.

Well, my question was rhetoric and humoristic. In old times ugly names were something people wore with pride. Like the swedish noble family Svinhufvud, which means "swinehead" or another noble name, Trolle, which means "troll". The heraldic shield of the Trolle family depicts a decapitated troll which isn't exactly the most beautiful sight I can think of...

>This is really quite similar to nordic mythology, except that the gallery
>of gods and goddesses is entirely different. Hel ruled over Hel, but was
>not considered a bad person even though that was a very bad place.

All these prechristian mythologies of the old Indo-Europeans (or Indo-Aryans as the old name was) seem to come from the same sources, the old (10.000 years?) stories from India and Aryana (today's Afghanistan and Iran). Haven't read them myself but there was a dramatization on TV a couple of years ago.

Please note that the use and meaning of the name Aryan, Aryana has nothing to do with the meaning and use that the nazi's put into it. Unfortunately more people today seem to know the hitlerian interpretation (which is wrong) than the real story.

>It is only in a few of the worlds religions that devil(s) were supposed to
>have power enough to rule over humans, and be allowed to do so by the
god(s).

In that case, giving computers names after devils isn't that bad after all?
They rule our lifes, yes?

>By any real logic, in a progression from Medusa to Hades, the next step
should
>be someone really positive. (Hades was a bit dour after all. ;-)

Prometheus should be the most appropriate name for a computer, he stole the
fire from the gods and gave it to the humans. A kind of equalizer of the old
days. He knew that information (knowledge) wants to be free (for all).

You probably have an older monitor. It requires a newer VGA or a SVGA to
sync with Atari signals. Also, this only works in mono mode, so you must
ground your mono detect pin. To get color you need a Multisync capable
of syncing down to the CGA range. Newer ones won't do this.

I thought there already was a card that has an ISA slot for the Atari.
If I'm right it is called Phanter II.
I read something about this on the german newsgroup.
If I'm wrong please correct me!

If you PC monitor can support ST rafresh rate(MultiSynchro?), with the next tip
you will see wath you are suposed to see:

St	VGA
1	-
2	-
3	-
4	if you want color the pin must be not connected so for MONO connect to GND(st: pin13)
5	-
6	-
7	-
8	-
9	13
10	-
11	1,2,3 (if you want color: 6->2, 7->1,10->3)
12	-
13	4,5,6,7,8,10,11

Yesterday i have do colors on, it work.
I have not already do the B&W on.

P.S: it's not from me, but i give it to you here because i don't remenber
where i sawn it on the WEB.

Some technical questions :

I'm looking for the structure of the "physical interface"
drivers for MetaDos (.BOS files)

Can MiNT manage IDE CD-ROM drives ?

Has anyone tried to put MiNT in an EPROM ?
(could be TOS for boot, then MiNT on a ROM-DISK)

Is MiNT able to run without TOS, once booted ?

Please help !

Hi Everyone.

I know this is completely unrelated, but I thought it might be a bit of fun for everyone.

Just do it.

FOLLOW THE INSTRUCTIONS - DO NOT CHEAT OR IT WON'T WORK AND YOU WILL WISH YOU HADN'T !!

Take 3 minutes and try this - it will freak you out!!

The person who sent this said her wish came true 10 minutes after they read the mail. But no cheating!!!

This game has a funny/creepy outcome. Don't read ahead,just do it in order.

It takes about 3 minutes - worth a try.

First get a pen and a paper.

When you actually choose names, make sure it's people you actually know, and go with your first instincts!!

Scroll down one line at the a time-don't read ahead or you'll ruin the fun!!

1. First, write the numbers 1 through to 11 in a column.

2. Then, beside numbers 1 and 2, write down any two numbers you want.

3. Beside the 3 and 7, write down the names of members of the opposite sex.

Don't look ahead or it won't turn out right!!

4. Write anyone's name (like friends or family....) in the 4th, 5th and 6th spots.

Don't cheat or you'll be upset that you did.

5. write down four song titles in 8,9,10 and 11

6. finally make a wish.

And here is the key of the game...

1. You must tell (the number in space 2) people about this game.

2. The person in space 3 is the one that you love

3. The person in 7 is one you like but can't work out

4. You care most about the person you put in 4.

5. The person you name in number 5 is the one who knows you very well.

6. The person you named in 6 is your lucky star.

7. The song in 8 is the song that matches with the person in number 3.

8. The title in 9 is the song for the person in 7.

9. The tenth space is the song that tells you most about your mind.

10. And 11 is the song telling how you feel about life.

Send this to 10 people within the hour you read this. If you do, your wish will come true. If you don't it will become the opposite.

strange but it seems to work!!!!

I came upon this thread a bit late, so I missed the initial postings. Are you all
discussing a ROM cartridge -> ethernet/ISA adapter?
I've been thinking along these lines for a little while myself, considering the
possibility of making an ethernet or ISA adapter for either the cartridge port,
the
parallel port, or (since I have two MegaST's) the MegaBus..

The advantage to using the cartridge or parallel port would be compatibility with
varoius systems. Using the MegaBus would just be neat.. :)

My concern was whether the cartridge port or parallel port have throughput rates
appropriate for the task?

Also, as I've not done any hardware-level programming on the Atari: if one were to
attach an ISA video card, how easy would it be to redirect the Atari's standard
video?

I'd really like to see an ISA bus adapter, or at least an ethernet adapter, for
the ST
released in the public domain!

later

I recently picked up a 1040STF, mouse, and monitor. When I power up the system, I get a blank white screen. After letting the system sit for up to 20 minutes, there is no change.

Here are some other symptoms:
1. Floppy spins for about 1/2 second or so when disk is inserted or when powered up. the drive light does not come on.

2. usually, very faint vertical bars are visible. these are spaces about 2mm apart from each other, and are slightly darker than the white background.

3. very rarely, when powering up, a row of bombs (one complete horizontal row) shows up. The disk may or may not spin when this happens.

The system does not apparently get unusually hot and an inspection of the machine's guts reveals nothing unusual happened to it, it's quite clean and no one has been in there before me. I wouls suspect that it blew a RAM chip, but how does one go about figuring out which one (if it is)? Any other suggestions?

Try re seatting all your socketed chips. Sometimes there is a little
corrosion or just a bad connection in a pin or 2.

These sort of problems are common with older STs. I would guess that some socketed chips have worked loose or have oxidised contacts.

Press home all socketed chips (if you really wat to be clever you can extract them, clean up the pins and put them back again). Check power and data connections to the floppy (from what you say I guess this is where the problem might be). Check that you have a good 5v across the large electrolytic capacitor close to the RAM bank. This can sometimes go dry and give RAM problems.

Good luck!

Roger

I've resocketed all the chips, pretty much the same behavior. I'll try checking out the capacitor. I assume it's the cylindrical one on the far lower left of the motherboard, next to the two rows of small chips (looks like 120ns RAM)?

Hi,

I know this may have been covered in the past but I have been
offered a 230 meg removeable Syquest. This was used with a
PC and has, I beleive, a cable that ends with a db9 plug and
is supposed to be a SCSI unit. My system is a TT. 4 st/16 tt ram,
Crazy Dots II board - two 120 meg maxtor hd's, 44 meg syquest,
and a CD drive all being SCSI. I have all running with AHDI.

Will this dirve work with my system and which cable should I try
to get to use it?

I assume that you are talking about an ezFlyer 230 mb. If it is SCSI and not parallel port it will certainly work with you TT. I have one plugged into this TT now. You need a cable with a MAC/Atari 25-D SCSI plug on one end and the appropriate plug for whatever you are going to plug it into on the other. The ezFlyer is auto-terminating.

Hi

I am trying to sort someone out who has a problem with their Notator SL software OR the dongle.

I'd be very grateful if I could borrow the software/dongle to find out what the problem is.

Thanks in advance

Steve

Some suggestions (to work from):

Is there termination on the LINK itself? It should be, it 's a chain end.

Can the ZIPplus be converted (back) to a standard SCSI ZIP
That is: does it have an extra board that can be discarded.

Your problem could be that one (or more) of the scsi lines drops below standard
operating condition at the fixed HD. Try moving it within the chain, preferably
at
the end.

Some CD drives are problematic on where they are in the chain. Again try moving
it
within the chain.

Ha! ..... and some don't work even when they are! (I'm thinking of problems with the TT bus) It's all a big mystery.

Hello,

I wanted to make partitions bigger than 256Mb on my 4 Gig. SCSI hard disk, but HUSHI HD-utility tells me I need a TOS version 4.0 or newer than that...

Currently 3.05 and 3.066 or 3.66 in other TT.

Does anyone have such TOS on file or on ROMs ?

Patches that I should use with 3.05 to make it work ?

Could you repply by E-mail... Haven't got time to browse through this too often...

markku.luoto@helsinki.fi

Cheers,
Markku

Hi,

I owned a 1040Stf several years ago and I'm planing to buy a MegaST 2 now (I really wanted that thing when I was 14 - now I'm going to buy a used one :-)) I was wondering if it is possible to connect the MegaST to a LAN / the internet. We're using a 10Mbit Cheapernet (ThinWire BNC) (TCP/IP, IPX/SPX and NetBeui Protocol), and we are going to install a 100Mbit twisted Pair in few weeks. Are there any solutions available to successfully connect a MegaST to these Networks?

Thanks
Michael

Internet: Yes, no problem with STinG.
LAN: You'll need hardware to attach it.

On the REV D board the space for a blitter socket is at front right, next to the cut-out. I installed a blitter on mine, but can't remember whether I needed to change a couple of solder pad bridges or not. I got it and the socket from Best Electronics, which came with instructions. The main chore is solder-suckering out all the pesky little holes :-)

Regards,
/Peter/

Hi Ben,
Perhaps you've read my previous problems with SCSI...Now everything works fine, but man oh man, it costs me hours and hours......
I got a Link but only a Seagate will work with it....cause this Seagte has it's own Term Power.I removed the internal Termination resistors, but that doesn't change anything at all, it keeps working!
Maxtor 300MB, I got one on my MegaSTE, works splendidly, for years, it's a very good brand.So I would advise you to stop with your STE, and buy a TT, here in Holland it will costs you $200,- ,then you have real SCSI .Now I got two Seagates on my internal SCSI and a scanner, a CDROMplayer and a CDWriter on my external SCSI, working all great.

>Is it possible to connect a 1.44mb SCSI floppy to an STE in the same
>manner as a hard drive?

Yes, I used an Insite 20 MB Floptical drive to do just that.

The upside is, all it takes is a Floptical drive and a Link to give a 1040STe access to 1.44 disks, as well as 20 MB floppies (if you can still find 'em). The down side is, you have to use your hard disk formatting utility to format disks and you can't use it to read extended or proprietary format disks.

(Don't forget the other option available to you -- finding an inexpensive, used Mega STE already set up with a 1.44 and TOS 206. That gives you a couple of extra RS-232 ports to play with as well...)

Tom

Hi!

I am having trouble getting to the quickfaq. How big of a partition can my 1040STE have on a HD?

Regards,

Jim

Depends on what program you format it with and the tos version. I have had 1 gig partitions on a 1040 with ICD's link and software. You are better off set as many smaller partitions as you can. ICD software allows you to hide and unhide partitions at will. Tos will only give you C-P. 14 partitions. Smaller partitions are faster to access and store data more efficiently than larger partitions.

AHDI 5 or greater allows you to use partitions at least up to 500megs.

Not sure about anything bigger

B.P.

The entire atari.org server is broken at the moment.

The max size for TOS 1.62 is 256Mb.
